M. C. Rigney and Mr. Thexton, one of the incorporators of the Ritter M. Co., are at the mine, near El Dorado, and pushing work on the tunnel.

Work on the Emery ditch, near El Dorado, is being prosecuted with vigor. Mr. Emery has been spending a great deal of money on his water system this year. A large number of men has been employed. Labor is in demand on the Rose Hill property.

The San Andreas *Citizen* hears that the Womble mine, in the Pine Log district, has been sold to an English syndicate. The Womble mine is near the Royal Con. mines. Wilbur, Castle & Peters formerly owned the Royal and sold it to Mr. Van Ee and his associates, comprising an English syndicate. ——The Silvery Queen mine, near Copperopolis, recently sold by W. H. Oxendine to Los Angeles people, has passed to the Zurich G. M. & M. Co., whose principal place of business is at Los Angeles, Cal.

Kern.

The Desert Lixiviation Co. at Barstow has started to handle 200 tons of ore per day. A 250-ton smelter is projected at Barstow.

J. A. Gowan has let a contract to E Shipsey to sink a double compartment shaft 100 feet on the Little Bonanza claim. The Defender and Little Bonanza join the Yellow Aster Co.'s property on the east. The Little Bonanza joins the side line of the Burcham and it is thought the extension of the Trilby ledge has been struck, as a vein 40 feet wide, which assays $8 to $10, has been found. Mr. Gowan will sink 500 feet.

Lovell White of San Francisco has sold to A. G. Newton of Los Angeles a tract of 5000 acres of oil land four miles northwest of Bakersfield, in the Kern river district, for $112,000. Boring operations are to be commenced by the new owner.

Bakersfield *Californian*: It is reported on what appears to be good authority that the California Standard Co.—an Oakland corporation—has a 400-barrel oil well on its land half a mile from McKittrick.

Mendocino

The Point Arena Oil & Land Co has been incorporated; principal place of business, Point Arena; capital stock, $750,000; R. F. Philips, H. E. Forst, C. M. Curley, E. P. Gilmore, W. C. Davidson, J. C. Halliday of Point Arena and E. J. Beane of San Francisco.

Mono.

At the Standard Con. of Bodie development work is in progress at the rate of 75 feet per week. One hundred and twenty men are employed. The mill concentrates are worth over $100 per ton.

Nevada.

Supt. Campbell, of the Mountaineer, intends to increase the capacity of the mill and install an air compressor for machine drills. The mill has ten stamps at present.

The Maryland-Idaho mine at Grass Valley has been bonded by A. P. Flaglor of New York in the interest of J. D. Rockefeller and other capitalists looking for mining properties.

A dam has been built a quarter of a mile below the mill at the California mine, near Washington, 337 feet long and 14 feet high. It will impound the tailings from the mill, which will be saved and worked later.

Nevada *Transcript*: J. Clark, owner of the Oro Fino quartz mine at Meadow Lake, has taken out $197 in gold from a pocket recently discovered on the claim. He pounded the decomposed quartz and sluiced it through a long tom. Mr. Clark has worked it to a depth of 3 feet and has a number of tons of rich quartz that he will pack out and mill next spring. The snow is 3 feet deep in the camp.

Nevada City *Herald*: Work at the Last Chance mine has been suspended until spring. ——The Imperial Copper & Paint Co. is working night and day, mining rock for shipment.

Placer.

The *Sentinel* reports a strike of gravel in the Oro gravel mine, near Iowa Hill. E. M. Armstrong is Supt. and has a large interest in the property.

Lincoln *News-Messenger*: At the Olgol copper mine, near Lincoln, a ledge of gold quartz 8 feet wide has been struck.

San Bernardino.

The Victory M. C. has been incorporated; principal place of business, Victory mining camp, Upper Holcomb valley. This company will work mines in Holcomb valley, near the Gold Mountain mine.

The Gold Mountain M. Co., near Holcomb valley, have suspended operations on their mine and are erecting a sawmill, which will cut 500,000 feet of lumber this winter for the mills and other buildings.

The Rose mine, ten miles east of Gold mountain, is employing fifty men.

San Diego.

The successful operation of low-grade gold mines at Hedges has furnished a practical illustration of what may be accomplished on the deserts of California, Arizona and Nevada under somewhat similar circumstances. Pumping water costs from 20 to 50 cents per ton at large plants.

The salt works at La Punta, on upper San Diego bay, have produced for the season of '99 about 500 tons. The property is owned by Shaffer Bros.

C. S. Josselyn, interested in property at Picacho and Copper mountain, near Yuma, is making preparations for extensive development work in both camps the coming winter.

Judge Torrance of the Superior Court of San Diego has authorized Receiver Trumbo of the Golden Cross mines at Hedges to erect a cyanide plant in connection with the works, with a capacity of 300 tons per day. It is stated that there are 900,000 tons of tailings available for treatment, and according to an analysis made they will average $2.03 per ton. The cost of treatment, it is said, will not be over 65 cents per ton.

Shasta.

(Special Correspondence). — The Reid & Clendenin group of six claims in Old Diggings district has been bonded for six months to C. D. Galvin, F. Grotifen and F. G. King, who will begin work soon. The price is said to be $75,000. The property has an aggregate of 1000 feet of tunnel. It has been shipping ore for some time to the Keswick smelter. A 5000-foot tramway and air compressors will be put in. F. G. King, Redding, will be Gen. Mgr.

The Cleveland Con. mines in the Bully-choop country started their 10-stamp mill two weeks ago. The ores of this property have always been considered of rebellious character, and the company who last worked it expended $152,000 in futile efforts, though they used every known process. The present operators—W. R. Beall & Co.—are making a success of their work under the personal supervision of Mr. Beall, who formerly operated in the ores of Silver City, New Mexico. He is saving his concentrates successfully and has reduced his tailings to $1 a ton.

It is reported that the sale of the Mammoth group of copper mines near Kennett will be consummated. A London and Halifax (Nova Scotia) company who have held an option for some months from J. F. Coleman have purchased through W. C. Boak of Halifax this property, which is in course of development by Mr. Coleman under an option from Saeltzer, Kahny, Jaegel & Wallace of Redding. The London and Halifax people are locally represented by W. A. Temple of Halifax, who also holds an option on the Balakala group of copper mines. The Coleman properties comprise 1000 acres, and sufficient preliminary work has been done to warrant additional large expenditures. In effect, Mr. Temple says it warrants an expenditure for as large a plant as there is at present on any copper mine on the continent. The ore body comprises an immense mass of copper sulphide.

Redding, Nov. 15th, '99.

Redding *Searchlight*: T. J. & F. O Jordan have taken from the Rabbit mine within a week $350.——In the Old Diggings district the Mammoth-Garfield mine, which was shut down on account of the inability of the Garlick electric plant near Copley to furnish power for its drills, has resumed operations. ——The Central mine that has long lain idle is being operated under lease to J. Thompson, who will ship his rock to the Keswick smelter. ——The Reid mine in Star gulch, O d Diggings, has been sold by E. A. Reid, J. Salnave and W. H. Clendenin to F. G. King, C. D. Galvin and F. Grotenfend. Mr. King says within ninety days he will put in machinery to work the mine on a large scale. Two power drills, an air compressor, pumping machinery and a double-wire ropeway leading to and across the river to rail connection will be the initial equipment. The Reid mine is a low-grade gold mine. The owners have for some time been shipping ore to the Keswick smelters.

Sierra.

Marysville *Democrat*: T. A. Carson, formerly Mgr. Good Title mine at Indiana ranch, has been developing a quartz claim three miles from Downieville, east of Goodyear Bar.

Quincy *Independent*: At the Claybank mining operations are being vigorously prosecuted by the company, which through Mr. Thomas has been reorganized.——At the Upper Dutch claim, under the management of Mr. Holgate, the mine is being put in order for next season.

Siskiyou.

The Carlshand-Walters copper mine, near Coles station, is reported sold to the Siskiyou Copper Co., of Rossland, B. C.

Yreka *Journal*: Strikes have been made at Willow creek, Squaw creek and Parks creek in the Gazelle district.——The Yreka Creek Dredger M. Co. has started scrapers excavating a basin for the dredger at the Booth claim, from which the dredger will work northward to Yreka—two miles. ——The privilege of mining the race track park belonging to the Siskiyou County Agricultural Society, a mile south of Yreka, has been sold to H. B. Gillis for a syndicate for $7000, of which $2500 is cash. Work is to be commenced as soon as machinery can be put up for pumping and hoisting.——The shaft in the Greenhorn No. 2 mine is down 160 feet and no bedrock yet. A large sandstone boulder was cut through last week, which was supposed to be bedrock.——F. W. Lloyd and D. W. Anderson have a ledge of quartz at Little Shasta, traced 500 feet, found to be 15 feet wide. It prospects in native copper and gold.

Tuolumne.

At the Santa Ysabel, near Stent, a shortage of water and non-delivery of the machinery in contract time have delayed operations. The directors, it is reported, have financed the company for any future needs. The mine, it is said, has ample ore reserves, officially estimated to run between $10 and $12 per ton, the cost of mining and milling being estimated at $4 per ton. When the forty stamps which are now in process of erection are completed they should treat 200 tons of ore a day.

The Spring Gulch mine, near the Buchanan, has been bonded by R. Marshall to Egbert & Willett.

At the Draper mine the machinery that recently arrived is set, and the mine is working night and day.

At the Santa Ysabel mine, near Stent, work on the new mill is making good progress. The new hoist, which will work down 2000 feet, has been finished. The ore at the 6th level, according to last reports, has widened to 3 feet.

Sonora *Independent*: Thirteen mines are in operation in the neighborhood of Carters.—— The unwatering of the Dead Horse mine at Carters has commenced.——The Grizzly main shaft is down 600 feet, and the mill running. ——The Jubilee M. Co. will put in water power at the Hazel Dell.——At the Providence, near Carters, the shaft is down 550 feet. Supt. Holland is drifting, raising and stoping from bottom level upwards. The rock carries 1½% of high-grade sulphurets and shows free gold. The 10-stamp mill is running.

COLORADO.

BOULDER COUNTY.

The San Blas M. Co., in Ward district, will soon have its mill in operation. Pending the completion of the improvements, no ore is being shipped except such as may be taken out in development. When making the upraise from the tunnel level for the new working shaft, a streak of ore was cut at 70 feet from the surface. The streak was 10 inches wide, of high-grade ore. A drift has been started to open this vein and is in about 16 feet; the ore body has widened to 16 inches. A large body of mill dirt accompanies the pay streak, the vein being 4 feet between walls.

CLEAR CREEK COUNTY.

Denver *Republican*: A strike has been made in the Gold Dirt mine at Empire by Byrne & Kilton. In crosscutting they have opened 2 feet of rich ore on a vein that lies parallel with the Gold Dirt. The same parties are also driving a tunnel to reach this and other lodes in Silver mountain. The tunnel has been driven 2000 feet and must go 2000 feet additional to reach the Gold Dirt and other mines in that locality. The company is working air drills.——The Newhouse tunnel is receiving its steel pipes for the tunnel. The blower now running will remove or blow in 12,600 cubic feet of air per minute from the heading of the tunnel, a distance of almost 1½ miles. ——A flinty rock mined in the Treasure Vault some time ago and thrown over the dump proves to be valuable. A party from Cripple Creek took a lease on the dump and has been cleaning up several hundred dollars a week. A shipment made recently ran six ounces gold to the ton.

FREMONT COUNTY.

(Special Correspondence). — The National Gold Extraction Co. are building an extension to their chlorination plant at Florence, whereby its capacity will be increased from 75 to 200 tons per twenty-four hours. An electric power plant is also being put in at this property.

The parties in control of the Arequa mill in Cripple Creek district have let contracts for the erection of a new chlorination mill at Florence. WASCOTT.

Florence, Nov. 13th, '99.

GILPIN COUNTY.

Central City *Register-Call*: At the Cook mine they are working both ways at the 800, and they have found from 9 feet to 15 feet of ore. Stoping is being carried on the 6th, 6th and 7th levels, and eleven air drills are being used. Seventy-five men are working night and day shifts, but with the completion of the Bobtail mill and the shipment of the ores through the Bobtail tunnel and Bates hill, the mine will give employment to 250 men. ——During the month of October the Burroughs Con. M. Co. shipped 462 cars of ore—3927 tons—nearly all of which was milling ore, the proportion of the smelting ore being 12 cars. The company is the heaviest producer at present in the county.

LAKE COUNTY.

The Yak tunnel, run from California gulch under Breece hill at Leadville, is in 8200 feet. Fifty men are employed in three shifts with machine drills run by compressed air. It has a depth on Breece hill of 1100 feet and will tap the Little Jonny mine at a depth of over 1300 feet. One of its principal objects was to exploit the territory of the Golden Eagle Co. of thirty-two acres adjoining the Little Jonny group on the west, which is being worked by lessees through four shafts. A good tonnage of copper sulphides is being shipped.

Leadville *Miner*: J. Rodman, agent of the Philadelphia smelter, is taking 300 tons of ore per day from Leadville.——A. Wuensch, who is directing the work on the Colorado No. 2 and Louisville mines, sent 1300 tons of sulphide ore to the local smelters in the month of October.——From the Colonel Sellers old zinc tailings dump 300 tons a day is being shipped to the New Jersey Zinc Works plant at Mineral Point, Wisconsin.——The Dollie B. at Leadville is shipping thirty tons a day of galena, which carries a good percentage of lead and good silver values, with some gold. ——J. S. Loder, constructor of the new smelting works at the Elgin site, says everything is in readiness to blow in the furnace. The Boston Gold-Copper Co. have a supply of ores on hand to commence operation and Leadville mines can furnish an unlimited supply of dry silicious and pyritic ore to run the furnaces.——Shipments of steel iron to the works of the Illinois and Colorado steel companies are on the increase. At present 300 tons per day is sent out. The lessees of the Catalpa-Crescent group, a heavy manganese producer, have paid out in the last three years $50,000 for ore hauling charges. Now their ore is loaded by the Colorado road at its bins and hauled to Denver, and in consequence the lessees make an entire saving of the hauling charges. The Kitchen shaft of the Morning Star is developing a large body of steel iron and sixty tons per day is being taken from development work.

LA PLATA COUNTY.

(Special Correspondence). — Half a dozen properties are being developed on the East Mancos, in the western section of the La Platas. The ore carries gold and is found in a contact vein between lime and quartzite. Among the properties is the Sundown, which shipped four cars of ore on the 5th inst. The October shipments from this property averaged $51 per ton in value. It is owned by Mancos people and is bonded to Cripple Creek parties. The Timberline mine, in same locality, shipped four cars of ore about Nov. 1. A good deal of activity in the matter of development is in progress in that district.

Mancos, Nov. 6th, '99. WASCOTT.

MONTROSE COUNTY.

Winters & Peterson have opened a copper find in Paradox valley, in the eastern extremity of the park, a section heretofore regarded as barren. They uncovered a vein of copper, 3 feet wide at the surface, carrying good values. The vein was traced on the surface for more than a mile and quantities of rich float found.

OURAY COUNTY.

A lead concentrating mill is to be erected on the Camp Bird at Ouray. The gold veins on the property extend east and west, and, crossing these, is a series of veins carrying lead of concentrating value that, when opened, will add largely to the output of the property.

SAN JUAN COUNTY.

(Special Correspondence).—The Gold King mill of forty stamps and twenty vanners is operating steadily, treating nearly 100 tons of ore per day. Supt. Hansen states that about 60% of the values, which are gold, are saved by amalgamation. Steps are being taken to add twenty more stamps to the same mill. The concentrates run heavy in iron. The Gold King people last spring organized the Silverton, Gladstone & Northerly Railroad Co., and built and equipped a railroad from Silverton to Gladstone, a distance of twelve miles. This road is a favorable factor in developing other mining properties up Cement creek.

The Sampson group, on Bonita mountain, has been purchased by the Gold King M. Co. and will be worked in connection with the latter. The purchase was an important one, as it put an end to costly litigation between the two ownerships, and it gives the purchasers the major portion of the ground on Bonita mountain.

The Red & Bonita Mountain M. Co. have completed a 10-stamp mill on their property in

this locality, which is opened by tunnel work amounting to about 3000 feet.

The Boston & Silverton M. & R. Co., made up of Boston people, have completed a 10-stamp mill on Cement creek, below the Gold King mill. Besides stamps it is equipped with crushers, rolls, trommels, jigs and concentrators. The mineral holdings of the company lie at different points above the mill, on which development work is in progress.

WASCOTT.

Gladstone, Colo., Nov. 11th, '99.

SAN MIGUEL COUNTY.

The Carribeau mines in Ophir district have been sold to the Venture Corporation, (Ltd.), of London, which also owns the Independence mine in Cripple Creek district. The price paid is stated to be $350,000. The Carribeau mine, which is the principal property of the group, is on Yellow mountain, half a mile from Ophir, and was owned by the Carribeau & Montezuma M. Co., of which C. S. Newton was Supt. It is one of the leading properties of the San Juan county. The ores are chiefly argentiferous galena and gray copper. In more recent years the deeper development of the mine showed an increase in gold values. A 20-stamp mill handles the output of the mine by concentration, the sulphides being sent to the smelters. The thorough sampling of the mine prior to the sale indicated an average value of $20.75 per ton. It is stated that the milling plant is to be enlarged to fifty stamps. The mill now at the mine suffered severely from a snowslide last winter, and it is the intention to remove it to a safer site before the enlargement is made.

TELLER COUNTY.

The production of the mines of Cripple Creek district is given by years as follows:

1891	$60,000
1892	687,310
1893	2,010,400
1894	3,250,000
1895	6,970,000
1896	9,100,000
1897	12,000,000
1898	60,060,000
1899 (estimated)	18,000,000
Total	$68,137,710

Lessees on the Flying Cloud, adjoining the Pinnacle group, are reported to have found an ore body on their vein at a depth of 180 feet, assaying nine ounces to the ton.

Mr. Winchester, lessee of the Doctor mine, has resumed shipments from the twelfth level of the mine, in which he has about 150 tons broken which will average $500 to the ton.

Whip & Glenn, leasing the Lansing of the Pinnacle group, have shipped eight tons of $1200 ore.

The output of the Lexington for October was 400 tons, some of which went $200 per ton.

A new compressor has been installed at the Volcano. Sinking is to be pushed. The shaft is down 125 feet and is to be deepened to 300.

The Grace, on Raven hill, is being equipped with machinery. The shaft is down 110 feet.

It is reported that a strike has been made on the Dead Pine, of the Ophir Co., in the seventh level of the mine. A winze has been started on the ore body. The mineral is rich in sylvanite.

IDAHO.

Martial law still rules at Wardner. Miners employed are obliged to have a good character certificate. The same rate of wages prevails: Underground men, $3.50 per day of ten hours; shaft men, $4 a day of eight hours; engineers, $4; surface laborers, $3; board, $1 a day; $1 a month hospital fees deducted from each man's wages. Idaho State militia are still on guard. Federal troops have not yet been withdrawn. A new miners' organization—The Industrial Union—has been formed.

The Boise assay office's shipment of $93,380 represents the receipts for the first ten days of November. The shipments for the corresponding period last year were $36,889.

BLAINE COUNTY.

The Hope group, on the Haily gold belt, has been bought by L. S. McLure and his company. The transfer is by a bond to run two years, and the price $80,000. During the dependency of the bond L. S. McLure will operate the mine, and will build a mill.

SHOSHONE COUNTY.

The United States Circuit Court is trying the suit between the Bunker Hill & Sullivan Mining & Concentratin Co. and the Empire State and Last Chance Mining Companies, which involves the title to a body of ore which the Bunker Hill & Sullivan Co. claims, and of which the Last Chance Co. has been in possession for some time. The attorneys for the Bunker Hill Co. are C. H. Lindley of San Francisco, Cal., J. R. McBride and A. Allen of Spokane, Wash., and J. H. Forney of Moscow. The Empire State and Last Chance Companies are represented by the firm of Heyburn, Price, Heyburn & Doherty of Spokane, Wash. The case is being tried without a jury. The Bunker Hill Co. has introduced testimony to show that its claim was located two or three days prior to the claim owned by the Last Chance Co., both having been located in September, 1885.

MISSOURI.

JASPER COUNTY.

The Commonwealth Zinc Co.'s No. 5 mine is to have a new mill of 150 tons capacity. Preparatory to sinking a second working shaft on mine No. 5 the company is drilling two 200-foot holes. The new mill will be located between the present working shaft, which at 70 feet depth has 65-foot face of high-grade ore, and the new shaft to be determined by the drill tests.

MONTANA.

The Anaconda Co. will not issue an annual statement this year.

FERGUS COUNTY.

McCornick & Co. of Salt Lake have bought the Spotted Horse mine. A. S. Bird, formerly of the Hope mine at Basin, will have charge of the property. The mine has been shut down for several years, lessees working the tailings from the old mill.

The Twin Bridges smelter has fired up after being shut down for two years. W. Owsley, who owns the smelter, with C. Schatzlein, will operate it, employing fifty men; 150 tons of ore will be treated daily.

A number of Butte mining men have contracted with the Michigan & Montana Copper Co. of Helena to produce 400,000 tons of concentrating ore within three years. The ore is to be taken from the Ibex, Cracker and Big Horn lodes at St. Mary's lake. A. M. Essler of Helena is at the head of the organization. He has a 300-foot tunnel on the Ibex, which will a depth of 450 feet.

LEWIS AND CLARKE COUNTY.

The biennial report of the Montana Limited M. Co., operating the Drum Lummon mine, near Marysville, presents some interesting facts concerning that property. The report was presented to the directors Oct. 24th and is for six months ending June 30th last. It shows that during the first six months of this year 37,652 tons of ore were treated by the 50 and 60-stamp mills, from which was obtained $212,638 in gold and $27,349 in silver, a total of $239,987. The expenditures were $221,987, and the net profit $18,030. The ore averaged $5.65 per ton in gold and 72 cents in silver. The cyanide plant during the period from April 18th to June 30th treated 28,459 tons of tailings, realizing $97,144, at a cost of $49,744, leaving a profit of $47,400. The cyanide plant can only be operated during warm weather, having to be closed on the approach of winter. In April a dividend of £16,428 was declared, or 6d per share. Development during the half year consisted of shafts, drifts, upraises, winzes and crosscuts, representing a total of 3708 feet of cutting, at a cost of $1.41 per ton of ore treated. The development of the south end of the property has been disappointing. Concerning this Supt. A. Burrell says: "Although the expenditure on development has not discovered any new ore bodies, it has demonstrated that the south end of the mine, in the neighborhood of shaft No. 3, is the most encouraging region at which to develop to great depth. The payable values in the ore bodies discovered on the 700 level only extended upward to the 600 and below to the 800, yet the 900 shows a wide, strong vein, filled with quartz and crushed slate, which extends a greater longitudinal distance north and south of the winze than the vein on the 700 or 800. The theory suggested in one of my reports may yet prove true, that we have irregular horizontal ore occurrences in this part of the mine, and this is to some extent borne out by the fact that the ground from the 400 to the 600 is barren, then from the latter level to the 800 it is productive, while on the 900 there is again a lack of pay ore."

NEVADA.

ELKO COUNTY.

The Dexter at Tuscarora produces over $1000 a day. It recently shipped to Salt Lake gold valued at $16,500, which represented a run of fifteen days.

LANDER COUNTY.

The Glasgow & Western M. Co., of Salt Lake, has bought the Copper Gulch group near Battle Mountain, and made the final payment of $30,000. Since taking possession of the group, the company has prosecuted work upon it with satisfactory results. The ores carry a uniform percentage of copper, with some silver and gold, and afford a good margin at the company's smelter.

LINCOLN COUNTY.

A strike of high-grade ore was made in the De Lamar mines last week in one of the lower levels, where a streak of ore 1 foot wide was uncovered. Drifting on this vein is in progress.

STOREY COUNTY.

No. 1 elevator has not yet been replaced in the C. & C. shaft and No. 2 holds the water at about 100 feet below the 1950 level. The latest official report is as follows:

VIRGINIA, Nev., Nov. 16, 1899.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 102 feet and 2 inches below the 1950-foot level station. No. 1 elevator has been running 18 hours and 30 minutes and No. 2 elevator 5 hours and 30 minutes. JOS. R. RYAN.

NEW MEXICO.

Socorro *Chieftain*: J. Morris has opened a 7-foot vein of coal, three and one-half miles northeast of Socorro.

COLFAX COUNTY.

The Thunder lode, fourteen miles west of Cimarron, has 7 feet of ore carrying 15% copper and gold which brings the value to $100 per ton.

OREGON.

BAKER COUNTY.

The total number of stamps now dropping in eastern Oregon, with those that will be in operation by January 1, is about 450, of which 276 are now in place in the vicinity of Baker City.

MALHEUR COUNTY.

(Special Correspondence).—There has been discovered here an ore body consisting largely of amphibolite schist with calcite. The deposit is 1200 feet in length. A shaft has been sunk to a depth of 100 feet. The ore was encountered at a depth of 60 feet. Crosscuts have been run from the bottom of the shafs 140 feet, with faces in ore. It is said all the ore will pay to mill. The property is five miles from the town of Malheur, on Union creek, and is known as the Golden Eagle mine. It is equipped with hoisting machinery and preparations are being made for the erection of a crushing plant of 200 tons daily capacity. The ore shows some free gold, but is found mostly in combination with iron and copper sulphurets.

Malheur, Nov. 12th, '99.

UNION COUNTY.

The Union copper mine, twenty miles from Union, is reported sold to Portland capitalists for $100,000.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Hawthorne Co., at Lead City, have put in a number of new concentrators and have commenced the erection of a large cyanide plant on Gold Run, half a mile below the mines, to treat the concentrates.

The Grantz Hidden Fortune mine, on the Poorman divide, has been closed down for the winter season. Three cars of ore have been shipped to Denver, Colo. The first shipment of one car returned $79,000. In the spring Mr. Grantz will build a milling plant.

PENNINGTON COUNTY.

While excavating under a 10-stamp mill on Jenny creek, near Rochford, recently, a vein of gold rock that assays $7.50 per ton was found on the Gorman claim.

UTAH.

The Utah land office decided this week that guano is a mineral and that the guano deposits on Gunnison island, Great Salt lake, can be worked under the law regulating placer mining locations.

BOX ELDER COUNTY.

M. E. Anderson, who is developing locations eight miles southwest of the Copper Mountain group, owned by Lewisohn Bros., reports that there is enough ore in the Copper Mountain group to justify the erection of a smelter.

SALT LAKE COUNTY.

The Shawmut M. Co. has bought the Crown Point mine for $25,000. The latter is an old producer, its copper, gold and silver values running up to $35 per ton. The Shawmut will begin a new tunnel that is to tap the Cuba, which will be made the main outlet for the company's ores.

Tribune: The Bingham Copper & Gold M. Co. has decided to build its smelter at the mouth of the tunnel being driven by the Bingham Tunnel Co. Sixty days ago a proposition came from A. H. Tarbet of the tunnel company in which he volunteered to construct a tramway that will transport the ores from the mine to the smelter at a gross cost of 25 cents a ton. The tramway will be 18,000 feet in length.

SAN JUAN COUNTY.

The Boston Placer Co., operating high bars on the Colorado river, has put in a gasoline pumping engine to raise water to a height of 120 feet by means of which 200 to 300 cubic yards are worked daily. They will put in a larger engine to increase capacity. Dr. C. E. Watkins, of Boston, Mass., is president of the company.

TOOELE COUNTY.

Operations at the Cigale mine and mill of the Boston & Mercur M. Co. on the West Dip have been suspended and will not be resumed until the roasting plant has been installed and the mill enlarged to a daily capacity of 500 tons. There are said to be 500 tons of ore blocked out.

WASHINGTON.

The United States assay office at Everett has a new furnace, owing to the instructions received some time ago to make all assays by the dry instead of the wet method. As the Puget Sound Reduction Works won the suit against the Government, in which the relative merits of the wet and the dry processes were at issue, it will be necessary for all previous assays, which were made in the old way by the wet method, to be duplicated by the dry. The smelter is understood to have about $35,000 at stake in these assays.

FERRY COUNTY.

Three cyanide plants are in course of construction or being contracted for at Republic—one of 75 tons, one of 100 tons and one of 200 tons daily capacity.

The Quilp M. Co. at Republic are getting a large quantity of water in the winze and will be obliged to put in a pump.

SNOHOMISH COUNTY.

The Marshall group of mines on Trout creek, near Index, has been sold to Eastern parties.

WYOMING.

CROOK COUNTY.

C. H. Miller has located a number of claims on the west side of Inyan-Kara mountain, west of the Black Hills, and has obtained good assays on float found there. He has a ledge 100 feet wide. Inyan-Kara peak is a postular outburst of rhyolite which has raised the Cambrian, Carboniferous and later formations on its shoulders, the sedimentary rocks standing nearly vertical about the peak and dipping away on all sides toward the plains. It is a prominent land mark.

FOREIGN.

AUSTRALIA.

Assays giving 3% of nickel and 17 dwt. gold have been obtained from samples of surface stone from a lease held by a prospecting syndicate at Gidgi, nine miles from Kalgoorlie.

The sulpho-telluride ore shipped from the Lake View Consols, and smelted in the eastern colonies, from April to July, inclusive, totaled 2250 tons, yielding 80,317 ounces fine gold, valued at $1,594,670.

BRITISH COLUMBIA.

(Special Correspondence).— Mines on the north fork of Kettle river are showing up well, considering the short time development work has been going on. W. F. Robertson, Provincial Mineralogist, has completed an examination of the different properties. The C. P. R. R. has spent $4,000,000 in getting into this section, after inspection by their experts. One hundred miles of main line and twenty-seven miles of spurs have been built since June, 1898. The main line runs to Greenwood, though the passenger trains stop at Columbia for the present, and the spurs reach Summit, Greenwood, Wellington and Deadwood camps. The grades are finished and the steel is being laid as fast as it can be obtained.

Hardy Mountain camp is three miles northwesterly from Columbia. It contains the Eagle, May Queen, Gladstone, Little Babe, Maple Leaf, Vancouver, Oak Leaf, American Eagle, Monte Carlo, Yankee Boy, Girl and Belle, Ruby, Golden Queen, Banjo and Caledonian. The Yankee Boy group are the only shippers as yet. Last week twenty tons were sent to the Trail smelter and shipments are to be made each month hereafter.

Goat Mountain camp is an extension of Hardy mountain. The best claims so far are the Independence, N. P., U. P., Copper Queen and Eastern Star. These are mostly gold-copper ores, assays running about 15% copper and up to $20 in gold.

The Eagle on Hardy mountain is a silver-lead proposition and the Maple Leaf and Vancouver at 20 feet are free milling, but they will probably alter to the typical ores of the district in depth.

The Seattle group is in Seattle camp, which is seven miles above the junction of the forks of the Kettle upon the north branch. The Seattle was discovered in '95. The group consists of four claims. The mine has large bodies of ore blocked out. The railway to Greenwood runs through the property. The Humming Bird and O. K. have the same vein as the Seattle. They changed hands last spring for $40,000 and are being developed.

Brown's camp is located on Volcanic mountain, ten miles from Columbia. The Volcanic, owned by R. A. Brown, is the best developed property. A tunnel 345 feet long has been driven to cut the ledge at 1300 feet. The Golden Eagle, Phil Sheridan and Earthquake are also in this camp. Near by are the English and French properties, on which much money has been spent with encouraging results.

Summit camp is ten miles from the valley. The C. P. R. R. has its spur almost in working order and the freight in ore from the camp will be heavy, as some of the largest bodies of ore in the country have been found in it. The B. C. was sold to a syndicate of Montreal capitalists last spring for $300,000. A three-compartment shaft is being sunk to 1000 feet.

Easterly from the B. C. is the Rathmullin group, and south of it the Oro Denoro. The main shaft is being sunk to the 300 level. This property was discovered by the rockmen working on the grade of the railway spur.

Four of the best properties in Central camp are owned by the Granby smelter people, and it is from them that much of the ore for that furnace is expected. The four claims are named the City of Paris, Lincoln, Denver and No. 4. The vein on the City of Paris is 12 to 16 feet wide and carries 9% copper, $22 gold and six ounces silver. The Lincoln ore is richer, but of the same character. The City of Paris, Lincoln and No. 4 are being developed by a tunnel, which will be 1300 feet in length and will tap the vein 700 feet below the surface. The Mabel, Lexington, No. 7 and Four Hundred are also promising properties in this camp.

In Wellington camp is the Winnipeg, which has made a favorable showing. Smelter returns give $70 in copper and gold. The mine is equipped with a good hoisting and compressor plant and seven air drills.

In Greenwood camp the Old Ironsides contains an ore body 83 feet wide, assaying $15 to $20. The total width of the ledge is about 300 feet. The Knob Hill has, however, the largest ore body in the camp and also the largest so far uncovered in the Province. The vein is 230 feet wide and the masses already blocked out are immense, though values are low—from $6 to $14 in copper and gold. There are 10,000 tons of ore on the dump. This property, as well as the Old Ironsides, belongs to the Granby smelter people, and the ore will go to the furnace in the Kettle river valley. The Victoria, Ætna, Fourth of July and Phœnix are near-by properties which have been acquired by the same people. The Stemwinder, Brooklyn, Rawhide, Snowshoe and Gold Drop in Greenwood camp each have immense ore bodies, assaying low in gold and copper. Nothing of a bonanza nature exists, but it is believed that with economical smelting and careful mining a large and permanent industry will be established.

Greenwood, Nov. 4th, '99.

The cleanup from the 5-stamp mill on the Granite & Banner, in Camp McKinney, recently, was valued at $633, from thirty-seven tons of ore. A crosscut shows the ledge to be 40 feet wide.

Grand Forks is to have a second smelter, J. A. Manly having donated twenty acres to E. T. Bradford, Gen. Mgr. of the Southern Smelting Co of Denver, Colo., and H. Gager. The plant will have a capacity of 200 tons daily.

CANADA.

Superior *Telegram*: At the Randolph, on Seine river, night and day crews are sinking in richer ore than ever. Things are looking well in the Seine river gold fields, particularly in the Randolph and Golden Star. Both properties are in better ore than at any time in the history of their development. The Randolph management are contemplating putting in a stamp mill and the erection of a compressor plant.

INDIA.

Indian Engineering: The Deccan M. Co. has struck a rich lode in the workings in the Linsagoor district. Specimens of the quartz show gold in remarkable quantities.

LOWER CALIFORNIA.

San Diego *Union*: The mines on Cedros island are to be reopened, after an idleness of seven years. It has been ten years since they

were first discovered. T. R. Lombard, Sr., of San Diego has bought out the interests of O. G. Schulenburg of St. Louis, Mo., amounting to 51% of the capital stock, and will develop the mines. Mr. Lombard is not the sole owner of the mines, though practically so. Some stock is owned by Nicholson & Michaelson of Philadelphia, Pa. It is said that the ore will be treated by the cyanide process. The cyanide plant is to be erected on the island and will be of large capacity. An expert, who examined the property some time ago, reported 80,000 tons of ore in sight that would average $12 50 a ton.

MEXICO.

The Batopilida mines of Chihuahua are producing eighty tons of ore daily. The mines are worked through the long adit completed last spring. A. R. Shepherd intends to enlarge the mill to 100 stamps, which will give a capacity of 200 tons. Over 1000 men are employed in the mines. The reduction works, compressor, electric works and foundry are run by water power.

SOUTH AFRICA.

The Simmer & Jack mill at Johannesburg will be increased after the war is over from 280 to 320 stamps. The lowest levels are reported looking well. The report at a recent meeting of the company shows that during the eighteen months ending June 30th the mill ran 508¾ days, crushing 685,010 tons, or a mean duty of 5.209 tons per stamp per twenty-four hours. The total amount of gold won on the plates was 215,137 ozs., or 6.281 dwts. per ton. In the cyanide works 490,221 tons were treated, resulting in a yield of 99,474 bullion ozs., or 4.058 dwts. per ton treated. The slimes process treated 122,635 tons, giving a return of 10,388 ozs., or 1.694 dwts. per ton of ore treated. The Simmer & Jack has taken place as the leading producer of the Rand.

The gold output from the Witwatersrand district during September (in bullion ounces) amounted to 411,762 ounces, against 459,709 ounces for August and 384,080 for the corresponding month of '99. From the outside districts 14,794 ounces were reported. The total return amounts to 426,556 ounces, as compared with 482,108 ounces for the previous month, a decrease of 55,552 ounces.

Personal.

DAN'L GRANT is the new Supt. Melba mine, Mokelumne Hill, Cal.

GEO. H. ROBINSON, one of Utah's prominent miners, is in San Francisco.

MATT W. ALDERSON is erecting a large cyanide plant near Sheridan, Madison county, Mont.

C. H. LINDLEY is now in the Cœur d'Alenes, Idaho; he will return to San Francisco about Dec. 1st.

O. S. LYFORD succeeds C. S. Knight as Vice-Pres. and Gen. Mgr. Siemens-Halske Electric Co., Chicago.

RICHARD A. PARKER has removed from San Francisco. His future headquarters will be at 8 Congress St., Boston, Mass.

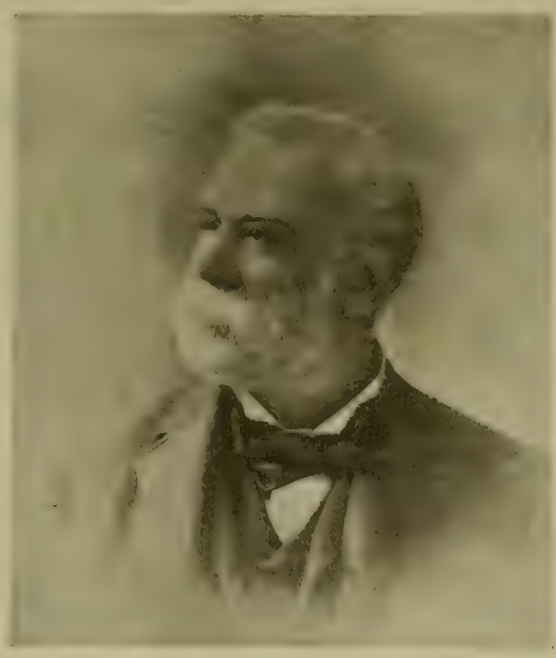
A. W. MCCUNE of Salt Lake, Utah, is at Rossland, B. C., in an effort to adjust the trouble over the eight-hour law.

H. G. MURRAY, formerly Supt. Lightner mine, at Angels Camp, Cal., will soon leave for China and Japan on mining business.

L. P. GOLDSTONE, formerly of Grass Valley, Cal., leaves West Australia to take charge of an English mining concession at Tientsin, China.

EX-GOV. PIFER of Illinois gets the appointment as member of the Interstate Commerce Commission, that, it was expected, would go to W. R. Wheeler or N. P. Chipman of California.

BEN WILLIAMS and brother, long prominent in the Copper Queen Co., Bisbee, Arizona, say they will establish headquarters in San Francisco Jan. 1, 1900. Walter Douglas is mentioned as the probable new Mgr.



GEO. F. BECKER, Government Geologist, sent to report on the mineral resources of the Philippines, has returned. He says that, while gold exists in Luzon and Mindanao, it is in no way comparable to other gold fields, and that any American miner going there would be disappointed.

F. W. HORNE, now in New York, says he wants to place a contract for the Chinese Eastern Railroad Marine department for eighteen vessels, averaging 4000 tons, to carry freight from Shanghai to Port Arthur and Vladivostok. Big repairing shops will be constructed at Port Arthur, and the entire equipment will be bought in this country. He proposes also to buy $150,000 worth of machine tools, and is ordering an entire equipment for the construction shops of the Shanghai docks. The contract calls for $50,000 worth of American pumps, tools, etc.

Commercial Paragraphs.

THE Compressed Air Machinery Co., 11-13 First St., San Francisco, Cal., is building an air compressor plant for the Ratcliff Con. G. M. Co., Ballarat, Cal.

CONTRACT has been given Fraser & Chalmers, Chicago, by S. S. Fowler of the Ymir Gold Mines, Ltd., B. C., for machinery for a mill of forty additional stamps, making a total milling capacity of eighty stamps.

THE LATE LYMAN C. PARKE.

The Late Lyman C. Parke.

Lyman Curtis Parke died at his home in Oakland, Cal., on the 11th inst., in the sixty-fifth year of his age. Deceased was well and widely known as a successful mechanical and mining engineer, a practical miner, and an originator and manufacturer of improved mining machinery. He was a son of Dr. Parke, a native of Pontiac, Michigan, one of five children, four of whom were prominent in the mining world. Three—Frank, Ira and L. C. Parke—were well and favorably known on the Comstock lode in the early days of mining in Virginia City, Nevada. L. C. Parke had some experience in the copper mines of Lake Superior, where his brother, Hervey C. Parke, was connected with one of the large copper companies owned in Detroit.

In 1870 Mr. L. C. Parke associated himself in business with John Waring in New York, under the firm name of Waring-Parke Co., for the purpose of manufacturing the Waring air compressor, which they introduced, and later the manufacturing of these air compressors was taken in hand by A. C. Rand, now the Rand Drill Co. In 1872 Mr. L. C. Parke determined to locate on the Comstock lode, Virginia City, and in 1873 associated himself with Mr B. T. Lacy, under the firm name of Parke & Lacy. Mr. Parke remained on the Comstock for a short time and later removed to San Francisco, where the firm that he was connected with for so many years has made so enviable a record by establishing itself as dealers in mining machinery. They introduced the first air compressing and rock drilling machinery on the coast, and also other special mining machinery and appliances. They also established houses in Salt Lake, Utah, and Butte, Montana, as well as in Sydney, N. S. W., Australia. To Mr. Parke and his associate, Mr. Lacy, is largely due the credit of establishing a market in the colonies for American mining machinery, which has become a large and growing business. Mr. Parke retired from the firm of Parke & Lacy Co. in 1889, Mr. Lacy having purchased his interest in the firm, and since then Mr. Parke continued to identify himself with mining interests.

Personally Mr. Parke was a genial gentleman, warm-hearted, affectionate, generous to all, and his kindly presence will be missed by his numerous friends and late associates.

Recently Declared Mining Dividends.

Raven G. M. Co., Colorado, $10,000; payable Nov. 20.
North Star Mines Co., California, $50,000; payable Nov. 20.
Silver King M. Co., Utah, $50,000; Nov. 10.
Swanswea M. Co., Utah, $5000; Nov. 10.
Total, $246,000.
Modoc M. Co., $10,000; Nov. 15.
Helena-Frisco M. Co., Idaho, 25 cents per share; payable Nov. 20.
Bullion-Beck M. Co., Utah, $10,000; Nov. 15.
Rambler-Cariboo M. Co., British Columbia, 1% on capital stock; payable Dec. 1.
Bonanza M. Co., Washington, $2500; payable No. 20.
Daly-West M. Co., Utah, $30,000; payable Nov. 20.
Creston M. Co., Colorado, $60,000; Nov. 15.
Portland M. Co., Colorado, $60,000; payable Nov. 20. Total, $2,497,080.

Industrial Notes.

—Lake Merritt, near Oakland, Cal., is to be dredged by contract.

—Denver, Colo., will spend $4,700,000 and own its water works.

—Spokane, Wash., has pooled all its light and transportation franchises.

—Oregon has sent 700,000 bushels of wheat since July 1st, '99, to Algoa bay, South Africa.

—The Pacific Improvement Co. is winding up its affairs. Its true history would be interesting.

—The Mexican Government is going into competition with private telephone and telegraph companies.

—During the first ten months of '99 the Seattle, Wash., gold assay office bought gold to the amount of $12,014,875.56.

—Chicago proposes to furnish annually 10,000,000 tons coke "equal to Connellsville coke" at $2 per ton. Doubtful.

—The Pennsylvania R. R. Co. has contracted for 100,000 tons steel rails to be laid in 1900, for which it pays $3,300,000.

—San Diego, Cal., expects in 1901 to be the Pacific terminus of the Utah & Pacific railroad building westward from Salt Lake City.

—The United States postal deficit for the fiscal year amounted to $6,413,885. The money order system was conducted at a loss of $105,106.

—A trainload of forty-five cars of steel rails—1000 tons—is at San Francisco loading on government transports for a government railway at Manila.

—B. M. DeLong of Quincy, Cal., has a franchise to build an electric railroad along the north fork of the Feather river through Plumas county, Cal.

—The Colorado Trades Assembly have abandoned their Denver organ. Many a newspaper has supported a cause, but no cause ever yet supported a newspaper.

—The Oregon Midland Ry. Co., of Ashland, proposes building a railway sixty miles down the Klamath river from Klamath Falls to Klamathon, Cal., a station on the S. P. R. R.

—Arizona will have active railroad building in 1900. A railway is to connect Flagstaff and Globe—200 miles, with a branch to Jerome. A smaller line is contemplated from Phœnix to Florence.

—So far in '99 twenty-six railroads have been chartered to operate in Oklahoma Territory. They are said to have 8312 miles of track; their capital stock aggregates over $50,050,000.

—From Tres Piedras, New Mexico, ten men monthly ship four carloads of mica to Cleveland, Ohio. The mica, such as cannot be split in plates, is ground fine and used in axle grease by the Standard Oil Co. and on wall paper.

—There are 2360 central station plants for generating electricity in the United States. These plants are owned by companies having a combined capital stock of $279,704,610, and employing 1,159,788 H. P. in engines or water wheels.

—The Continental Telegraph, Telephone and Cable Co.'s leading directors and stockholders in the Western Union Telegraph Co. are said to oppose the Bell Telephone Co. The old contract between the Bell Telephone and the Western Union, under which the Bell concern paid 20% of its income to the Western Union, expired in '95. The Telephone Co. has been since then a competitor of the Western Union.

—The White Pass & Yukon Railroad, illustrated on pages 572 and 573 of this issue, bought $200,000 worth of steel rails to extend its line from Lake Bennett to Closeleigh, on Fifty-mile river, four miles below White Horse rapids.

—A new industry has developed—gathering scrap iron. Everywhere throughout the United States men are scouring "the rural districts," buying up old metal of every kind procurable and selling it at from $12 to $15 per ton. Even the junk business reports a "boom."

—Sheet lead for tea packing in Formosa is brought from Australia in pigs; after being melted it is poured between two large tiles, the required degree of thickness for the sheet being obtained by foot pressure, then trimmed to suitable sizes and shaped for soldering.

—An automobile designed to take the place of the present motive power on the Erie canal, and tow the canal boats, is now building in Hartford, Conn. The automobile will be the largest and strongest ever made and will cost about $3000.

—The Manila hemp held by Americans has been profitable. In '98 the price of this product of new American possessions in the Philippines was between 6 and 7 cents a pound. When the war between Spain and the United States broke out there was a fair supply of the fiber in the United States and a large supply on the way to the United States. After Dewey's blockade the price went up, but ships laden with the fiber for the United States were allowed to sail. When this limited supply was exhausted there was a total cessation of supply, not only in the work of the blockade, but in the interference with the supply for export by the armies working in the interior. The price of fiber has increased gradually until it is now about three times what it was at the outbreak of the war, and the prospect is that it will go considerably higher. Substitutes in the Manila hemp line are not numerous. The substitute in general use at the present time is the sisal or Yucatan hemp. It is not so good as the Manila article, lacking nearly all of the strength and fineness of the latter, but does for binding twine and similar purposes. Even this substitute has advanced in price, selling now for about 9 cents a pound. There is no reason why this should be the case except the natural sympathy of this product with the hemp market and the increased demand for it by reason of the decline in the use of hemp. The supply of the Yucatan article is ample, and there has been no interference with getting it to market. There is also an American hemp which is used to a considerable degree in the manufacture of binding twine. It gives fair satisfaction. It is the common belief of people generally that jute is also used for this purpose, but there seems to be no confirmation of this belief from the cordage people.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 7, 1899.

636,703.—AGRICULTURRL IMPLEMENT—M. J. Anderson, Dufur, Or.
636,628.—DUST SHIELD FOR HUBS—Burch & Walling, Amity, Or.
636,494.—BICYCLE BRAKE—G. M. Collins, Davenport, Wash
636,245.—FRUIT EVAPORATOR—B. Cunningham, Liberty, Or.
636,649.—WHEEL WRENCH—W. J. Fay, Colegrove, Cal.
636,258.—COIN CONTROLLED MECHANISM—H. Hahn, S. F.
636,662.—ACCOUNT BOOK—R. W. Hamilton, San Diego, Cal.
636,349.—NUT LOCK—F. M. McCartea, San Juan, Cal.
636,345.—TROWEL—P. S. Mille, Seattle, Wash.
636,391.—VALVE—Smyth & Reardon, S. F.
636,586.—GAS GENERATOR—O. P. Swem, Tacoma, Wash.
636,600.—NECKTIE FASTENER—E. M. Wickersham, Phœnix, Ariz.
636,702.—TIE PLATE SETTER—G. R. Wilton, Los Angeles, Cal.
31,810.—DESIGN—C. O. F. Youngstrom, Phœnix, Ariz.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Death of an Engineer and Inventor.

At Middletown, N. Y., William Franklin Durfee, engineer and inventor, died on the 15th inst., aged 66 years. In June, '62, he went to Lake Superior to test the suitability of the iron ores for the manufacture of steel by a method invented by William Kelly. He succeeded in producing some ingots of steel from which on May 25th, '65, were rolled the first steel rails made in this country. He then established at Wyandotte, Mich., the first analytical laboratory built as an adjunct to the steel works in the United States, for the purpose of studying the Bessemer process and the use of the regenerative furnaces.

This Paper Fifty-Two Times, POST PAID, $3.00

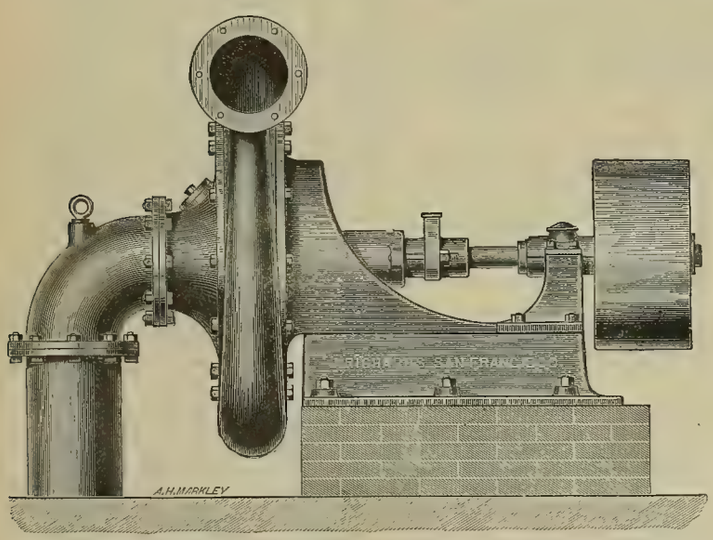
Cheaper Way of Sending Circulars.

SOME firms dealing in mining machinery occasionally issue circulars that are supposed to be distributed by mail, mostly to men who moved from the place a year ago. Everybody understands what a waste of money is always involved in issuing circulars—whether distributed by hand or sent by mail; and while it is evident that those who get out circulars really want to advertise, it is apparent that they don't know how to get at what they do want. As there appears to be a few (mostly believers in "mining directory" lists) who still think that a circular is a good thing and forget that the circulars that they send out, even when received, are always accorded the same fate that they themselves give to any circular that they receive, namely, throwing it away unread, it is deemed advisable to suggest to them a way in which they can have their circulars do them some good.

To those who have mining machinery for sale, or who want to reach the mining world, and feel disposed to cling to the ancient notion of circulars sent by mail at random to probable or possible customers, it is suggested that they can, without doing violence to their established notions, secure better results in a better way. The following tells them how it can be done, being an illustration of how to do effective circular work at a greatly reduced cost. There are very few circulars that contain more than can be prominently displayed in one page of this paper. Of this issue, for instance, there are printed 8,856 copies.

8,856 good circulars, well printed on fine paper, would cost -	$30 00
Envelopes for same - - - - - - - - -	7 00
Addressing them - - - - - - - - - -	6 50
Postage (sealed envelopes) - - - - - - -	177 12
Total - - - - - - - - - . -	$220 62

Thus we find that to get 8,856 circulars as far as the postoffice would cost $220.62. This is on the supposition that the 8,856 names to whom the circulars are addressed are those of men likely to be customers of the concern sending the circulars, which is very improbable, as no one firm can secure a live list of possible customers that would equal in value a list containing the same number of subscribers of a good live paper that is bought and paid for and seen every week and passed around until in many cases it is worn out from the number of readers through whose hands it goes. Now, instead of spending $220.62, which is mostly thrown away, how would it do to take the same circular and put it on one page of the **MINING AND SCIENTIFIC PRESS,** the cost of which in place of $220.62 would be $42, or less than one-fifth of $220.62, with a hundred times the greater likelihood of value? The manufacturer or dealer in mining machinery who will spend $220.62 in an attempt to get his business before 8,856 people could save $178.62 by putting that same circular on one page of this paper, and be sure to get it before 8,856 definite, known men, thus securing a certainty instead of an uncertainty, and at less than one-fifth the cost of the old way.



If a circular is so good a thing as some seem to imagine, here is a chance for them to get what they want at less than one-fifth what it would cost them by the old way, and with certainty of result.

In figuring on the cost of these circulars it is assumed that each one is sent sealed, which involves a two-cent stamp, but even were they sent unsealed they would still cost one cent apiece for postage, which would make them cost $132.06. Herein we show how lovers of circulars can substitute certainty for uncertainty, and at much less cost to themselves. The force of these remarks lies in their personal application.

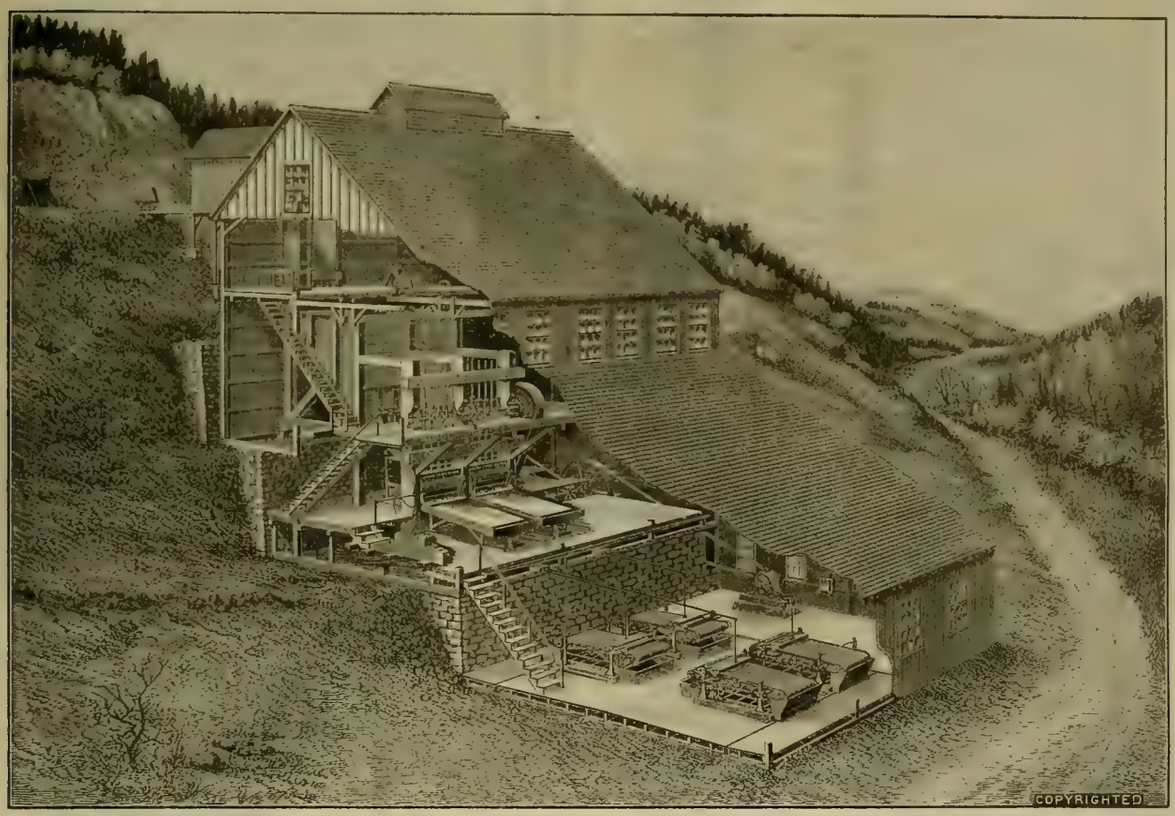
SAN FRANCISCO, CAL.
Nov. 18th, 1899.

MINING AND SCIENTIFIC PRESS, 330 Market St.

THE MOST WATER FOR THE LEAST MONEY!

For low lifts and large volume of water a Centrifugal Pump cannot be excelled.

We make the RICHARDS PATENT CENTRIFUGAL PUMP. Single suction, consequently less tendency to churn. Perfectly balanced runner. Protected bearings. Removable side plates. Accessible runner. Runners made of diameter to suit the lift. Will not churn at high speed.



Our 1899 catalogue tells about over fifty different kinds of pumps. Free to those interested.

Builders of All Classes of Mining Machinery.

The above is an illustration of a First-Class Modern 10-Stamp Gold Mill. For particulars, send for Catalogues.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO.,

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

FIRTH'S DRILL STEEL, 16 cents per pound.

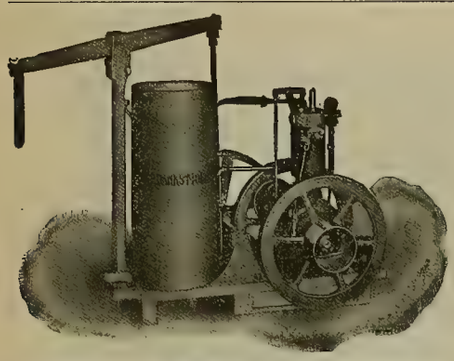
General Arrangement of Pelatan-Clerici Plant.



The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

CORRESPONDENCE SOLICITED.

$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,
30th and Blake Streets, - - - - DENVER, COLORADO.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

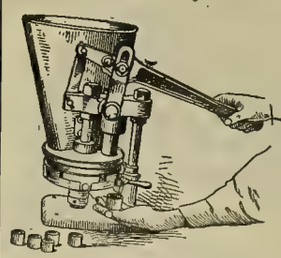
AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE GUTTA PERCHA RUBBER AND M'F'G CO.,
30 and 32 FREMONT STREET. Telephone Main 1813. SAN FRANCISCO, CAL.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over800 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.
—BUILD THE—
"Union" Gas Engines,
Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 300 h. p.
"UNION" COMBINED HOISTS in Sizes from 3 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 300 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Patent Pending.

PERFECT CUPELS
can be made by anyone with ease and dispatch with
CALKINS' CUPEL MACHINES.
Compact, easily operated, can't get out of order, everlasting.

NO ASSAY OFFICE COMPLETE WITHOUT ONE.

Descriptive Pamphlet and Price List Mailed on Application.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time. If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to

No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

THE

Pelton Water Wheel Company

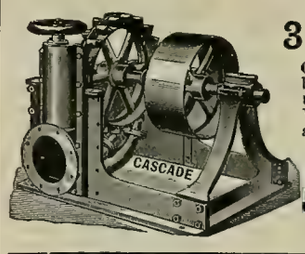
Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.



The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

Send for a Pamphlet of either Wheel and write full particulars.

JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

32 FIRST STREET, SAN FRANCISCO, CAL.

Market Reports.

SAN FRANCISCO, Nov. 16, 1899.

SILVER.—London, 27⅛d; New York, 58¾; San Francisco, 58⅜@58¾; Mexican Dollars, 47⅛@48½; New York exchange, sight, 10; telegraphic, 12½ cents premium.

LEAD.—New York reports quiet, $4.57½ bid, $4.62½ asked; brokers' price, $4.40. Local, pipe, 7¾@7¾c; sheet, 7¾@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake dull at $17; brokers' price, $17. Local—Mill copper plates, 23¾c.

The Calumet & Hecla Co. has concluded the sale of a large quantity of copper to both domestic and foreign consumers at 17c, with deliveries extending into March, 1900. The quantity of copper marketed by this sale has been one of the largest for a long period, and is said will aggregate several millions of pounds. According to figures compiled by the New York Metal Exchange the production of copper in October was almost 24,000 tons, an amount in excess of any previous month in the history of the exchange.

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—11¼@20c per pound.

TIN.—Unsettled, $26.50 bid and $27 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $50; export, $45.50 @46; carload lots, special rates.

Within the week quicksilver for export has gone up 50 cents—a small increase, but denoting that the highest price has not yet been reached. Unless old producers can make an increased output, and the new mines add materially to it, the prices may be expected to go still higher.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

ZINC.—Dull and easy; $4.70 bid, $4.80 asked.

Although the Missouri-Kansas Zinc Miners' Association issued orders to resume operations last week, many owners were unable to start their plants for want of coal. The zinc mining district is threatened with a coal famine, and there seems to be little hope for improvement. The new zinc ore schedule puts the price of 60% zinc ore at $40 a ton in the bin, instead of $43, the old rate. Notwithstanding the recent troubles between the smelters and mine owners, this year's output for the ten months to Nov. 1st shows an increase in the value of the zinc and lead produced amounting to $3,735,532 over that of the corresponding period of last year.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15¼c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

SALT LAKE CITY.

An Important Factor in Transcontinental Travel.

No one crossing the continent can afford to cut Salt Lake City from his route. The attractions of the place, including the Mormon Temple, Tabernacle and Church institutions, the Great Salt Lake—deader and denser than the Dead Sea in the Holy Land—the picturesque environment and the Warm Sulphur and Hot Springs, are greater to the square yard than any locality on the American continent.

The RIO GRANDE WESTERN RAILWAY, connecting on the East with the Denver & Rio Grande and Colorado Midland Railways and on the West with the Southern Pacific (Central Route) and Oregon Short Line, is the only transcontinental line passing directly through Salt Lake City. The route through Salt Lake City via the RIO GRANDE WESTERN RAILWAY is famous all the year round. On account of the equable climate of Utah and Colorado it is just as popular in winter as in summer. Send 2c to W. H. Snedaker, General Agent, 14 Montgomery, San Francisco; J. D. Mansfield, 253 Washington, Portland; W. C. McBride, 47 East Broadway, Butte; E. Copland, 215 Dearborn St., Chicago, or Geo. W. Heintz, Acting General Passenger Agent, Salt Lake City, for a copy of "Salt Lake City—the City of the Saints."

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 2055.—VOLUME LXXIX Number 22. SAN FRANCISCO, SATURDAY, NOVEMBER 25, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

In British Columbia.

The Silver King mine, near Nelson, at the foot of navigation of the west arm of Kootenay lake, is one of the oldest mines in the country, and, as far as development has progressed, is the most valuable in the district. The mine is eight miles south of Nelson by road on Good mountain. It is owned by the Hall Mines Co. of London, England, who also own the smelter in connection with the property. There are eighteen claims in the property, of which four are in the silver-copper belt, and the remainder in the gold belt, of which Rossland is the center. The silver-copper lode strikes east and west through the diabases, and has the peculiarity of having no distinct walls, the country rock on both sides of the fissure being highly impregnated with ore. The ledge has been traced continuously for over 3000 feet, and has branched to the east. A great deal of work has been done on it, and in prospecting the diamond drill has been used advantageously. The first twenty tons of ore shipped from this mine netted $8000. One of the accompanying illustrations was taken in a station at the shaft in one of the lower levels.

VENTILATING FAN MADE FROM CEDAR SPLIT WITH AX, ALL UP MINE, PHILIPP'S ARM, B. C.

MAIN SHAFT UNDERGROUND, SILVER KING MINE, NELSON, B. C.

Prospectors in a new country are often obliged to resort to makeshift methods and some ingenious contrivances result. At the All Up mine, on Philipp's Arm, in the western part of British Columbia, the tunnel was greatly in need of ventilation. Accordingly, the miners decided to make a blower, but having no lumber rived out boards from cedars with an ax and constructed a serviceable fan which accomplished the desired ventilation. The accompanying engraving gives a good idea of the appearance of the ventilator. Among the numerous picturesque streams in the province is Elk river which, near the town of Elko, dashes among abrupt walls, forming a series beautiful cascades. A mining camp has been established on Elk river, from which some rich ores have been shipped. About the divide between Bull river and White Horse creek the country is rugged and little prospecting has been done. The formation consists of limestone, quartzite, conglomerate and shales, much broken and distorted. The accompanying engraving illustrates the appearance of the country. It is taken at an elevation of 9000 feet, the surrounding mountains rising far above it. No vestige of vegetation is discernable. It is one of the wildest spots in the Southeast Kootenay.

Two dykes cross Bull river below the divide. These have been traced from the summit east of Bull river, across the river to Burnt Bridge creek. On the most southerly of these dykes mining locations have been made.

DIVIDE BETWEEN BULL RIVER AND WHITE HORSE, SOUTHEAST KOOTENAY, B. C.—ELEVATION 9000 FT.

ELK RIVER, NEAR TOWN OF ELKO, SOUTHEAST KOOTENAY, B. C.

The Mount Morgan Mine of Queensland; Translucent Paper; An Automatic Pump Governor; The First Patent Issued, 610. Mineral Specimens; Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Commercial Paragraphs, 614.

RESPONSIBLE INFORMATION from the Cape Nome region is to the effect that there will be no great hardship or suffering there the coming winter, as there is an abundant store of provisions on hand to sustain those wintering there—about 2500. A great rush to these diggings is anticipated in the spring of 1900.

THE Paris Exposition will open April 15, 1900, and close November 5 of the same year. The Exposition grounds are in the heart of the city of Paris, including the Champs de Mars and the Trocadero, both banks of the Seine for nearly a mile, and the Esplanade des Invalides and a portion of the Champs Elysees.

THE magnitude of some of the mining operations now being undertaken in various parts of the world in the development and operation of propositions which a few years since would have been considered worthless, is an indication of the rapid and successful development of new conditions in the industry of mining. This change has largely been brought about by the application of the latest and best scientific knowledge. Electricity and the cyanide process are to a great extent responsible for many changes for the better in mining, and there is a tendency toward the adoption of further and still more radical changes than those which have marked the development of the past decade in several branches of the industry.

IN the metal market there is at present a downward tendency. Copper was the first to drop, then zinc and lead, and now iron is wavering. A false condition in either the money or metal market cannot be sustained very long at a time, for so many interests are vitally affected that a remedy for any critical or oppressive condition is at once sought and generally found. Some predict a lower price for iron, but unless there is a radical change in the industrial world, and a great falling off in demand for machinery, it is doubtful whether this year's prices for iron may not be considered low next year. In the meantime the iron miners will endeavor to arrange to meet the demand next season. They made an effort to do so the past season, but were unable to create a surplus.

Factors of Success in Mining.

In Colorado the leasing system is largely in vogue, and to this system is due to a great extent the rapid development and success of the mining industry of that State. It has been argued that this system will work equally well anywhere, but such is not the case. Generally speaking the Colorado mines are high grade, or where low grade the transportation and reduction facilities are such as to render the cost of handling and treating the ore after it is mined a matter of moderate expense. The active competition of railroads, smelters and custom mills for business has been of great advantage to the miners of that State, and there are found those conditions which approach most nearly the ideal. Arizona has many mines producing high-grade ores but economical transportation facilities do not as yet obtain, except to a limited extent. A single instance of the operation of an Arizona mine illustrates the prevailing condition. When the Hillside mine was first discovered in western Yavapai county, the nearest wagon road was twenty-five miles distant, and the nearest railroad point about fifty miles away. The first shipments of ore were made on burros. A wagon road was then built to the nearest railroad point at Garland and the ore hauled in wagons to that station and shipped to Colorado smelters for treatment, at an average cost of $52 per ton for transportation, sampling and reduction charges. The conditions are now greatly improved but there are still many mines in Arizona so distant from railroads or other cheap transportation that the ores must be very rich to pay.

What applies to Arizona applies with equal force to parts of California, Nevada, Utah, Montana, Idaho, Washington and Oregon. If the railroads in those States were to show the same enterprise as is shown in Colorado, in extending their lines into mining districts, a great change would result and a remarkable impetus would be given the industry in those sections.

The lack of these facilities has resulted in the owners of many mines, at great distance from railway transportation, putting in reduction plants at the mines, and it can be said of the installations of recent years that but few are failures, owing to advanced knowledge of ore treatment.

Twenty-five or thirty years ago large plants were built in many places remote from railroads, hundreds of miles across deserts, or high in the rugged mountains, at great expense for transportation and first cost of machinery, and, in many cases, when these great plants were completed, it was found that they were wholly unsuited to the treatment of the ore. It was no uncommon thing to find a smelter built to treat silicious ores and amalgamating mills set up to reduce carbonates of lead.

The great fortunes made in mining have been the prime factor in working a change—in bringing order out of chaos. The necessity of employing technically educated men to superintend various branches of the mining business has long since been recognized, and old, time-honored but inefficient methods have been forced aside for new ideas and common sense application of scientific principles.

Each year sees mining upon a higher plane than before, and it is now known that, with a knowledge of the requirements of a mining enterprise, and with the necessary means to provide for them, mining is robbed of its risks to such a degree as to render it as safe an investment as any other business, and safer than many which have heretofore been considered as among the least hazardous of commercial enterprises.

The Value of Mining Shares.

The idea of basing the value of mining stock on the annual earning capacity of a mine, without due regard to the length of time during which the output can be maintained, is clearly an erroneous one and is calculated to place a fictitious value on the stock. There is no reason because a mine is able to produce a million dollars net profit in a year that the stock should be given a valuation of $10,000,000 unless it can be shown by ore reserves in sight that it is actually capable of producing that amount. And even if it does output this amount the value of the mine constantly decreases as the ore is extracted unless development increases the ore in sight as rapidly as it is removed. An ore body is like a reservoir filled with water. There is but a given amount in the deposit and no more can be extracted than it contains, and when it has once been removed it is never replaced, though other ore bodies may be discovered in close proximity. Often these deposits are so erratic in form and value that a knowledge of their net value can only be obtained by mining and reducing the ore.

Important Decision.

In the case of the Buxton Mining Co. vs. the Golden Reward Mining Co. of South Dakota, the United States Court of Appeals has sustained the judgment of the lower court in favor of the plaintiff for trespass by defendant company. The Golden Reward Co. drove drifts from the workings of the Golden Reward and Silver Case mines into the Bonanza claim of the Buxton Company and extracted a large amount of high grade ore from the latter property. The Buxton Co. did not discover the trespass for nearly three years when the caving of the workings was indicated by surface subsidence. An investigation was made, and it was then discovered that the Golden Reward Co. had been guilty of trespass. Plaintiff demanded judgment in the sum of $220,000, with 7 per cent interest. The action was tried at great length, and at unusual expense to both parties, the trial lasting from February 9, 1898, to March 18, 1898. The jury awarded judgment in the sum of $61,500, which verdict has been sustained by the court of appeals. No questions of geology were raised in this action except incidentally, the whole question being one of fact and value.

Geology in Mining.

In order to intelligently prospect and develop mines, a knowledge of geology is almost indispensable. It is true that often when the outcrop of a vein has once been found, the fissure is continuous and there is little danger of losing it; but, as often, the vein is faulted and all trace of it lost, when a knowledge of geology is useful, if not necessary, in rediscovering the lost fissure. But it is in prospect work that geological knowledge is most valuable. There are numerous monuments of ignorance of the rudiments of geology in every mining district: shafts sunk and tunnels driven uselessly, being started too high or too low to intersect the ore-bearing stratum. In the oil fields it is the same. Wells are driven without regard to geological conditions, based on luck, and these ventures are generally failures. It is remarkable, in the time of unusual activity in mining or in the oil fields, how quickly "geologists" and "experts" develop among those who have never given the subject previous attention. Ordinarily, it requires years of study and careful observation in the field to entitle one to be called a geologist or to make his opinion of value in geological matters.

THE combination of zinc mining companies in Missouri has been unable to keep up the price of ore as they had anticipated. The smelters' combination was evidently the stronger, and has been victorious for the time being. The zinc producers now threaten to build a co-operative smelter. The falling off in demand for spelter owing to war in South Africa has also been a factor in affecting the market price for ore.

A PECULIAR mining suit is to be tried in the district court of Eureka county, Nevada, wherein the alleged owner of a patented mining claim seeks to recover possession of his property which he claims was taken and withheld from him by a mining corporation, which caused his mine to be "jumped," and which has held the same adversely for several years.

A DECIDED IMPETUS is being given the mining industry at Cripple Creek, Colo., by reason of the rich strikes recently made there. The Isabella mine is credited with shipping two cars of ore last week worth over $160,000. Within the twelve months ending November 1st over $17,000,000 have been produced in the district.

AMERICAN PRODUCTS are gaining favor at present more rapidly in China than those of any other nation.

Concentrates.

A POUND of coal, when burned, develops 11,000 heat units, English.

ARKOSE rocks are those having essentially the same constituents as granite, from which rocks they are derived.

GRANULITE is a rock consisting essentially of orthoclase (potash feldspar) and quartz with, usually, small garnets.

AT the Mount Morgan mine in Queensland, Australia, open vat chlorination has proven cheaper than cyaniding.

MINERS in various parts of California, who are working placer mines, are now saving the black sands, that contain gold.

IT is said some gold-bearing veins of promise have been discovered near the Sierra Pintada placer fields in Lower California.

MANGANIN is an alloy of mangan, nickel and copper. It can be drawn or cast, and is used in the manufacture of measuring instruments.

IT is not good practice to open mines by surface excavations in the early history of a mine, unless those workings can be readily drained.

PRINTERS' INK is a mixture of oil and lampblack fused at a temperature of 550° F. It costs from 4 cents to $16 per pound, according to quality.

THE Supreme Court of California has decided that a contract signed by a portion only of the owners of a mine is not binding and cannot be enforced.

SOME tufas make excellent building stones. They occur of various colors and shades, are easily quarried and dressed, are enduring and ornamental.

QUICKSILVER deposits are usually accompanied by serpentine in California, but cinnabar is found in California and elsewhere, where serpentine does not exist.

THE pressure of the atmosphere is 14.7 pounds per square inch, with the barometer standing at 30 inches; when the barometer reads 28½ inches the pressure per square foot is 2010.96 pounds.

DOLOMITE is a composition of carbonate of lime and carbonate of magnesia. Sometimes the dolomite is rendered impure by the presence of sand and clay and often of bituminous matter.

THE large tonnage of low grade ores available in Boulder county, Colo., mines are to be treated by milling, concentration and cyaniding of the tailings, experiments in that direction having proven satisfactory.

THE sulphide of manganese is of rare occurrence. It is called alabandite. It is an iron-black mineral, and might readily be mistaken for iron. It is not of large commercial importance by reason of its scarcity.

MARLOID is produced by burning untanned leather in oil. It resembles celluloid, can be polished and pressed into any form. When hardened, it can be made soft and elastic by immersion in a salt or alum solution.

AN iron cap or gossan does not always denote the existence of copper ores in depth, though this not infrequently proves to be the case. Some copper mines show very little iron at the surface and no copper at all.

ANDALUSITE and chiastolite slates usually occur in the neighborhood of granitic intrusions. Staurolite slate is a dark micaceous slate in which occurs crystals of staurolite. In some cases these latter pass over to chiastolite slates.

UNDERHAND stoping is not commonly practiced in the United States. It is sometimes employed in mining small veins of rich ore, where little timber is required. Where timber is used in underhand stoping it cannot be recovered.

IN recent years much attention has been given to large deposits of gold bearing rock, which are devoid of defined limits (walls), the pay determining the extent of the ore deposit. Some deposits of this character have yielded largely.

THE rolling, billowy appearance seen in some regions, generally called "hog wallows," is supposed to have resulted from the accumulation of sand about clumps of brush, which was subsequently destroyed, leaving the hillocks, which are usually found matted with roots of the dead bushes.

IN some old English mines in Cheshire copper carbonate is found impregnating sandstones of the Triassic age. The copper was leached from the crushed sandstone by means of sulphuric acid and the copper recovered by precipitation on scrap iron. The sandstone contains about 1% copper.

AN atmosphere containing 15% carbon dioxide extinguishes a light, though a light will burn in a mixture containing 75% carbon dioxide if the other 25% be oxygen. Air mixed with 50% carbon dioxide occasions rapid death. A candle will be extinguished when the percentage of oxygen falls below 17%.

THE oil-yielding formations of California are known to extend along the entire length of the interior valley between the coast range and the Sierra Nevadas, from Tehama county on the north to Kern county on the south, and beyond the Tehachapi mountains in southern California from San Luis Obispo county to San Diego county.

AT the Hafod smelter at Swansea three samples are taken from ore sent in. One is used by the smelter for arriving at the assay value; another is given to the miner or his representative to get assayed wherever he sees fit; a third is inclosed and sealed so that it may be used in the event of considerable difference between their assays and some other.

WHITE LEAD is supposed to be lead carbonate, but the mixture varies greatly. It is generally composed of lead carbonate, lead hydroxide, lead oxide and water. Acetic acid, particles of metallic lead and lead acetate are not uncommon admixtures. The different shades of white are caused by these varying mixtures. Wherever coal is burnt or gas used for any purpose, wherever animal matter decays, the white lead painted surface blackens. The effect or color of such paint cannot be brightened by the addition of ultramarine or Prussian blue.

IN the case of Johnson vs. Sage, 44 Pac. Reporter, 641, the Supreme Court of Idaho decided that the president and secretary of a mining corporation have no power to appoint an agent or attorney in fact, to manage, control, sell or transfer the property of the corporation without being themselves authorized so to do, by order or resolution of the directors, duly adopted by such board.

THE Wilden process for coating steel and iron consists in the use of a bath composed of zinc, tin and aluminum. This mixture, it is claimed, produces a coating on iron and steel so firmly adherent that the sheets will stand working after it has been applied, will resist corrosion, and can be heated red-hot without injury. The most approved mixture is the following composition, by weight: Zinc, 84%; tin, 14%; lead, 1.5%; aluminum, 0.5%.

THE construction of tanks underground for the purpose of "catching up" water on the various levels and preventing it going to the bottom of the mines is recommended. These may consist of boxes made of planks, or may be excavations in the rock. They are placed below the floor of the level. By providing the tank with an outlet pipe and valve, skips in the shaft may be loaded and the water removed without use of a pump.

A SUMMARY of geological conditions on Keweenaw point, Lake Superior, is as follows: A deposit of sandstone and conglomerates were overlain by lava flows, which was either later overlaid by sandstones or the lavas were injected into the sandstones in flat sheets; subsequently the beds were fractured and faulted when mineral-bearing solutions penetrated the rocks from below, depositing the copper in the conglomerates, sandstones and lavas and in veins of the fissure type.

QUARTZITE is a compact, crystalline, granular aggregate of quartz, either in irregular crystalline grains or in developed crystals. In some quartzites which were originally sandstones there has been a secondary enlargement of these grains, silica having infiltrated and cemented the fragments into a hard, dense quartz rock. The polarization microscope shows this silica to have crystalline form, and that separate crystals envelop each grain of the original sand rock. The occurrence of small quantities of mica sometimes gives the quartzite a schistose appearance. With a considerable increase of the mica, the rock becomes a mica schist.

THE California Supreme Court has declared unconstitutional the legislative act of 1897 which provided that every California corporation must pay its employes at least once a month, and that it is unlawful for a mining or other corporation to contract to pay for a longer period than one month. In the Superior Court of Sierra county A. Johnson got judgment against the Goodyear Mining Co. for labor. The Supreme Court held that the law was class legislation, modified the judgment, affirming that portion awarding to the laborers their dues, and reversing that part which gave a lien upon the mining company's property for the payment of the attorney's fees.

THE following "Concentrate" appeared in the issue of the 11th inst.: "Next Saturday's issue of this publication will comprise a total of 52,144,128 square inches of surface." An explanation is asked. The issue referred to was that of the 18th inst. The statement was exact; the fact was in precise accord therewith. Of last Saturday's number—the 18th inst.—there were printed 9000 copies; deducting sheets preserved for files, spoiled proofs, etc., there were 8856 complete copies printed and issued. Each page of the paper (11½x16 inches) contained 184 square inches of surface; the thirty-two pages, therefore, contained 5888 square inches of surface. Multiplying the number of square inches in each copy by 8856, the number of copies printed and issued, gives 52,144,128 square inches of surface in the issue, as stated.

THE mines of Gilpin county, Colo., have produced in the past forty years over $80,000,000. Most of the ore shoots outcrop at the surface. Rich discoveries are not of uncommon occurrence in the district now. The veins are of the fissure type, continuous both longitudinally and in depth. The veins are divided into gold-bearing and silver-bearing lodes. Where these merge into each other, the values are found in both metals. The usual proportion of gold to silver in the mines of the county is five ounces of silver to one of gold, though in the silver belt proper the ores carry little or no gold. The veins lie in two systems—one striking east and west, the other northeast and southwest. Dykes of porphyry (andesite) accompany many of the veins of each system. The dykes frequently form a wall of the vein, and it is stated that a departure of the vein from the dykes is marked by a low tenor of the ore.

THE geology of the Cripple Creek, Colo., region has been described by Whitman Cross as a group of rounded hills seven to twelve miles southwest of Pike's Peak, 9000 to 10,000 feet above the sea. These hills consist almost entirely of volcanic rocks, and indicate the successive phenomena of a volcano, the principal material being breccia or tuff, resulting from a succession of explosive outbursts, while the igneous magmas erupted were, first, andesite; then phonolite (in numerous eruptions, alternating with explosive outbursts); and finally a number of highly basic eruptions in small dykes. Gaseous exhalations played a part at certain periods, and later hot waters circulated through the mass, and decomposed the rocks to a great extent. The formation through which the Cripple Creek volcano burst, and upon which its superficial materials lie, is granite gneiss. Since the close of volcanic activity these hills have been greatly modified by erosion.

LYDDITE, the high explosive, is picric acid in a solidified state. Picric acid was first made in 1771, and was for more than a century used as dye without its explosive qualities being even suspected. If lyddite be heated gently it may be poured from one vessel to another with safety. If heated over an intensely hot fire it chars with a slight fizzle. If pounded on an anvil there is no explosion. When a detonator is exploded in contact with it the explosive force of lyddite is liberated. This detonator is a sensitive body which explodes with great violence, and in practice it is not placed in the lyddite shell until the gun is about to be fired. In making lyddite carbolic acid and sulphuric acid are mixed in equal proportions and the temperature raised to the boiling point, when nitric acid is allowed to flow into the mixture. The yellow crystals which form in the bottom of the vessel after cooling are pure picric acid. When it is desired to make lyddite shells, the picric acid crystals and the semi-fluid mass are poured into the empty shell.

WHEN the walls of a vein are too soft to safely support stulls, heavy plates (3-inch plank) may be put in at head and foot to give the necessary resistance and security; but if the walls are too soft to render this method secure, the stulls must be set at right angles to the walls, the ends resting on posts, and the stulls must be framed, in the same manner as a cap, to abut against the posts above and below the stull, to afford security. Mining upward, the posts of each set or floor rest upon the stull of the set beneath, the foot being held in place by the shoulder on the stull. If the stulls are not framed, sprags must be inserted to keep the posts from being crowded in by the pressure of the walls. In this manner a stope may be carried up to any desired height. Where necessary, lagging may be driven behind the posts. To keep sets thus placed in position, they should be strengthened by ties extending horizontally from stull to stull along each side of the set. It then becomes virtually a square set, though differing from the latter in framing of the timbers.

THE ore bodies of the Bunker Hill and Sullivan mines at Wardner, Idaho, occur in a mass of hard, dense quartzite, which has a breadth of several thousand feet and a length of many miles. A great compressive stress has fractured this metamorphic rock along a plane marked by a fissure which cuts the bedding of the upturned quartzite in its strike, and also intercepts them on its dip, the fissure having a lower angle of dip than the quartzite. Mineral solutions have come up along this fissure plane and deposited their contents in the numerous branching fissures which extend into the hanging wall quartzite, and the spaces of dissision occasioned by the crushing of large masses of the normal rock have also received the minerals from these solutions, and now form the large ore bodies of the mine. That replacement has been an important factor in ore deposition here is not likely. The minerals are normally the sulphides of the base metals, principally galena, with gold and silver. The hanging wall is not defined, being irregular and practically limited by the commercial value of the material. The foot wall has been a plane of great movement of these rock masses during and subsequent to the formation of the ore deposits, resulting in the formation of heavy gouges. The extreme width of the mineralized zone is 300 feet.

PETROLEUM is recognized as a mineral substance obtained from the earth by mining, and lands in which petroleum occurs are properly classed as mineral lands. Judge Ross decided that oil lands were subject to entry under the placer laws, but Secretary Hoke Smith, in 1896, ruled that petroleum was not mineral and that petroleum lands were not mineral lands and might be taken by the States as lieu land to compensate for the loss of the sixteenth and thirty-sixth sections. Congress in February, 1897, passed the following: "That any person authorized to enter lands under the mining laws of the United States may enter and obtain patent to lands containing petroleum or other mineral oils, and chiefly valuable therefor, under the provisions of the laws relating to placer mineral claims; provided, that lands containing such petroleum or other mineral oils, which have heretofore been filed upon, claimed or improved as mineral, but not yet patented, may be held and patented under the provisions of this Act, the same as if such filing, claim or improvement were subsequent to the date of the passage hereof." Oil lands may therefore be located in a manner the same as placer grounds in twenty-acre tracts, and an association of eight individuals may locate 160 acres. Where the lands have already been subdivided by Government survey these claims must conform to the established lines of the survey.

A GOOD ventilating device for mine workings, either shaft or tunnel, may be constructed where a stream of water and a fall of 30 or more feet are available, by arranging a vertical box 6 inches square, having both ends open, with the lower end projecting downward into a tank or barrel of water a foot below the surface of the water. Above the surface of the water about 6 inches an aperture is provided into which is inserted a pipe or box which leads into the shaft or tunnel. A stream of water is conducted by flume or pipe to the top of the vertical box and the water allowed to fall into it. A hopper at the top is beneficial. The falling water carries downward with it a large volume of air which, unable to escape upward through the descending column of water, rushes out at the aperture near the bottom of the box and is driven forward by the constantly accumulating air, thus supplying a quantity of fresh air in the mine workings at the end of the ventilating pipe. The water falling in the column pipe overflows from the tank or barrel and escapes. All joints should be tight and the ventilating pipe made as smooth as possible on the inside and constructed without sharp bends, as these inequalities of surface and changes in direction obstruct the free passage of the volume of air. The higher the vertical column pipe the greater the quantity of air. A good-sized stream of water should be employed and several slats of wood nailed across the hopper to break the solid stream, increases its efficiency.

THE announced perambulating smelter on wheels to ramble round the country turning out gold bricks as it rolled through the mining camps has not materialized. Probably some of the necessary details of success escaped the attention of the originators. The latest in that line comes from a New York establishment which is building miners' prospecting wagons, "constructed so as to possess strength, and all machinery carefully shielded, so that underbrush, etc., will not interfere in any way with its operation. The idea in these prospecting wagons is to provide a miniature mining camp complete which can be transported at the rate of two and a half to four miles an hour. A small ore crusher is mounted upon the truck, so that it can be connected directly with the motor, and an assay furnace is also provided to test the gold-bearing ore as it may be found. The seat in front can be turned down to provide a bunk for two persons, and while one man drives the wagon his companion can busy himself making assays of the findings. Ample food supplies can be carried, and with one of these wagons a trip of two or three weeks can be made by prospectors." Such a "miniature mining camp" would doubtless be provocative of hilarity among real miners and might thus be of value in contributing to the gayety of the passing hour. It is believed, however, that the result of the work of the "companion" who "busied himself making assays of the findings," would not be of sufficient accuracy to justify serious mention.

California Drift Mining.

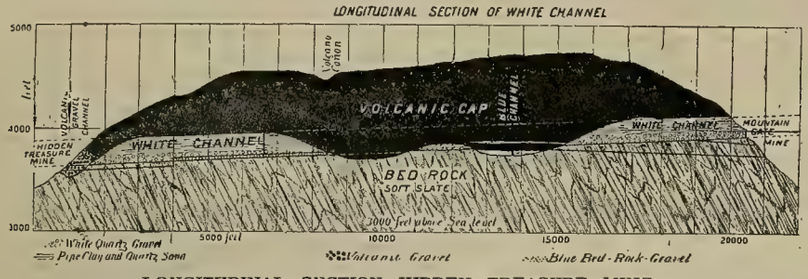
Written for the MINING AND SCIENTIFIC PRESS.

Drift mining originated in California and has reached its present magnitude largely as an outcome of the inhibition of hydraulic mining. At first an experiment, it proved successful, and rapidly developed into a great industry. It is in some respects unlike other mining, though the general principles are essentially the same as those in other mines. It consists of removing the richer gold-bearing gravel lying in the channels of the ancient rivers from the bedrock without disturbing the overlying low-grade gravel and volcanic material, which is sometimes hundreds of feet in thickness. By the hydraulic method, these deep deposits of gravel, sand and lava were washed down by the powerful streams from the monitors and the material carried into the flumes by the large volume of water employed. Some of the largest and most remunerative hydraulic mines had banks several hundred feet in height, from which the volcanic cap had been previously removed by erosion, and all of the remaining material—the detritus accumulated at the bottom of the ancient river—was gold-bearing and easily washed down. The greater number of channels, however, were covered under hundreds of feet of volcanic mud, tufa and brecciated lava fragments, and some of them by massive flows of basalt and andesite. These could not be economically hydraulicked, and drift mining had already made considerable progress before the courts enjoined the hydraulic miners, compelling them either to cease operations altogether or to resort to the drift method.

Most of these ancient river beds lie flat, or nearly so, having a normal grade the same as modern streams, though in some localities—as about Murphys and Vallecito, in Calaveras county—the channels are tilted and faulted by the movements of the earth's crust, indicating that dynamic disturbances have occurred there within comparatively recent time.

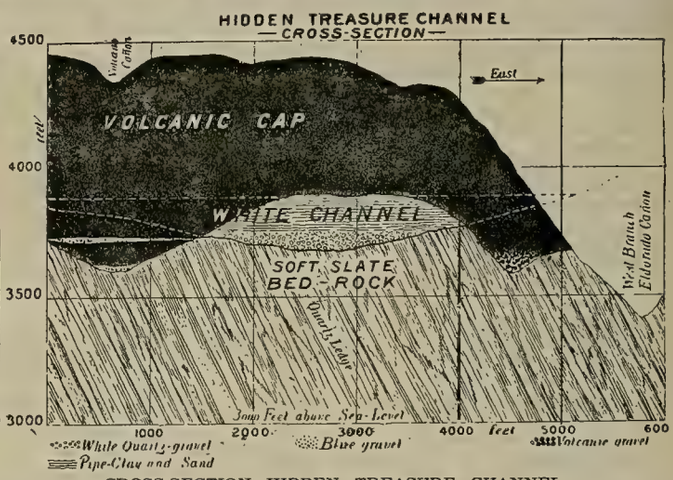
The gold-bearing channels are reached through tunnels driven directly in on the channel, or through a crosscut tunnel extending through the bedrock into the rim or underneath the channel; or else a shaft is sunk through the lava cap and upper layers of gravel to bedrock and the channel worked from the station at the foot of the shaft.

A long, main gangway is run up the channel, from which the gravel is breasted out on either side, the roof being usually supported by a system of posts and breasting caps. The gravel is removed only to such height as is necessary to recover the pay, or, if the pay streak be shallow, only sufficient gravel is removed to permit the work of mining to proceed, and, in many drift mines, low roofs result, the miners having to crawl upon hands and knees into the workings and to work for hours daily in a cramped, stooping position, this being considered more economical than the removal of a larger amount of ground, permitting of more freedom of action to the miner and a corresponding increase of work. Experience has shown that it pays to take out as little ground as possible.



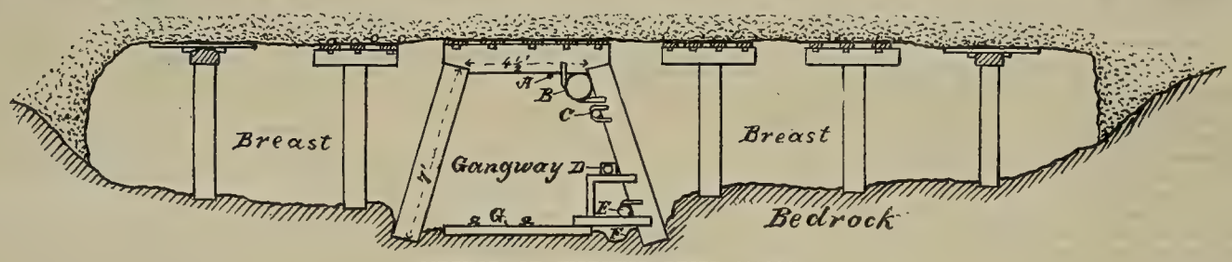
The main gangways are substantially timbered, are often of large size, having two tracks, and in most respects resembling the main drifts of a quartz mine. It not unfrequently occurs that the bedrock of the channel swells upon the removal of the gravel, and this becomes a source of great annoyance and constant expense by reason of the movement and breaking of the timbers and the constant shifting of the tracks. When swelling ground is encountered, selected, heavy timbers are employed, the sets placed a short distance apart; the legs of these are given a very wide spread at the base, sometimes setting at 45° to 50°. This is found to afford the most satisfactory results, and, by frequently relieving the ground as it pushes upward, the sets are kept in fairly good shape. The tracks, however, require constant attention.

Ordinarily the main gangway of a drift mine is carried low—that is, below the general level of the bedrock—because of the inequalities of the latter, it being always desirable to have the main drift and drainage passages as low as the lowest portions of the bedrock along which the workings extend, and also to afford convenience in handling the gravel removed from the breasts which are on either side of the main gangway. Along the gangway loading platforms are laid, upon which the gravel is thrown by the miners, who, as they proceed, shovel out the small material and pile up the large boulders behind them to assist in supporting the roof. From the platforms the gravel is loaded into the cars standing on the tracks in the main gangway, their tops being usually but little above the loading platform, and sometimes below it.



The posts used in breasting gravel are short and have a stout, heavy cap placed above them. Lagging is inserted between the cap and the gravel, or not, as the case may require. Some ground is so firm as to require no timber support at all, being held up by walls and piles of boulders.

In the early days of drift mining in California the business had to be learned; the miners were apt scholars and made rapid progress, but their methods were comparatively crude and necessarily expensive, though with the advance of time improvements were introduced in almost every branch of the business, particularly in ventilation—a most important matter in the system of mining and in the underground haulage of the gravel.



The largest drift mines in California are on the Forest Hill divide, in Placer county. It is estimated that the drift and hydraulic mines of this county on the Forest Hill divide, at Iowa Hill and about Dutch Flat, have produced nearly $70,000,000 in gold. A large area, constituting miles of channel, has been worked and exhausted, but there still remains untouched far more than has been exhausted. Hydraulicking in Placer county has nearly ceased, but drift mining will be continued for many years to come. Whether or not the result of the past operations in these mines constitutes a safe basis for calculation of

ELECTRICALLY DRIVEN SAWMILL, HIDDEN TREASURE MINE.

the value of that remaining, cannot be said with certainty; but, from present knowledge of existing conditions, the outlook for a long continued era of prosperity is more than favorable.

Among the largest and best equipped drift mines of the Forest Hill divide are those owned by the Hidden Treasure Mining Co., whose lengthy tunnels have outlets at Sunny South, Centerville and Damascus. The property comprises a group of claims having a total area of 2328.8 acres. Within this area are several channels, some large, others small, but all rich in gold. These channels lie at various levels and intersect each other, often rendering their identity uncertain, until a large amount of work has been performed. The variation in elevation of these channels and their intersection at various points has given occasion for some unique mining engineering in the development and operation of this extensive property.

The main gangway at Centerville is 3715 feet above sea level at its mouth, and has been driven under the mountain over 8000 feet. The entrance at the Hidden Treasure tunnel is at an elevation of 3644 feet, and it has run into the hill 8500 feet. This tunnel enters the mountain at Sunny South. The Mountain Gate tunnel is at Damascus, on the opposite side of the Forest Hill divide, at an elevation of 3748 feet, and penetrates the ridge over 7000 feet. The summit of the divide is nearly 1000 feet higher than the channels of the ancient streams now being exploited for the gold they contain.

MORNING STAR DRIFT MINE, IOWA HILL, PLACER COUNTY, CAL.

The Hidden Treasure–Mountain Gate channel runs through this property for a distance of 18,000 feet. This was a river of unusual size among the ancient streams, and at one place is more than 1600 feet wide. The greatest width of gravel breasted on this channel is 800 feet, the average being about 400 feet. The bedrock is soft and requires but little powder to break it. On exposure it swells, and, as above mentioned, this proves a source of trouble and expense.

A second important channel, known as the Deep Blue channel, also has great length within the company's lands—its extent having not been determined.

The last annual report of Superintendent H. T. Power shows that during the year the average number of tons of gravel extracted per day was 332, the average number of tons of waste 46, making a total average of 378 tons. The gravel is breasted to the height of 6 feet. The average number of men employed for the year was 170. The cost of mine timber per day was as follows: Timbers framed and ready to load in cars, $30; one-sixth cost of operating electric plant, $2.25; labor, saws, etc., $8.75; total, $41. The average flow of water from the tunnel at Sunny South was 310 gallons per minute. The flow from the tunnel at Centerville was 375 gallons per minute. A ditch three miles in length conveys water from the mine below Centerville to the storage reservoir below Sunny South, for use in developing electric power for traction and other purposes. The flow from the tunnel at Sunny South is also conveyed to the reservoir. The pipe line from the reservoir is 1820 feet in length and consists of 820 feet of 9-inch double-riveted steel pipe, 500 feet of 8-inch and 500 feet of 7-inch standard screw pipe. A 3-foot Pelton water wheel, with flywheel weighing 2000 pounds, works under a vertical head of 850 feet, and is capable of developing 200 H. P. Water is delivered through a cast iron double nozzle, fitted with cut-off hoods, with levers to work successively, connected to a Replogle electric relay governor by rack and pinion. This governor serves the two-fold purpose of economy in the use of water, and that the supply shall be approximately proportioned to the instantaneous demand for power at that point. The water wheel is belted to two general electric direct-current generators, with capacity, at full load, of 50 amperes at 250 volts. It is set to maintain a constant voltage (under all loads up to the capacity of the plant) at the blower plant in the tunnel at Centerville, 14,000 feet distant. A skeleton switchboard, with switches, rheostat circuit-breaker, fuse, lightning arresters, potential and current indicators, is installed. The length of the transmission line from the generator station to mouth of tunnel is 13,000 feet. The size of wire is No. 0 B. & S. gauge. The electric motor car, for traction purposes, which is here illustrated, weighs 6500 pounds. It is fitted with two railway motors of 10 H. P. each, geared to the axles and equipped with brake, switches, controller, electric headlights, etc. The speed at which the tunnel trains are operated varies from six to twelve miles per hour.

ELECTRIC TRAMWAY, HIDDEN TREASURE MINE, PLACER COUNTY, CAL.

At the mine at Centerville a 5 H. P. motor drives two circular saws used for framing mine timbers, making wedges, foot blocks, etc. A second motor of like capacity operates a No. 4½ blower, which forces the air through a line of 11-

GRAVEL WASHING PLANT, HIDDEN TREASURE MINE, PLACER COUNTY, CAL.

inch pipe to ventilate the mine. Trains of fifteen to thirty-two loaded cars are taken each trip, the total carload weight being 2700 pounds, viz., weight of car 750 pounds, weight of gravel 2000 pounds.

The trolley is of copper wire, securely fastened to the roof of the tunnel, 6½ feet from the rail. The single trolley wire and return rail system is used. The tunnel is laid with twenty-five and thirty pound steel rails, resting on ties 3 feet apart. The present plant is designed for an eventual length of 10,000 feet of tunnel. It is being operated at this time over 7320 feet of trolley line, viz., 6500 feet under ground and 820 feet outside.

With horses the maximum average capacity was 180 tons of gravel per day. The record by electric traction for the six days ending December 3, 1898, shows 3019 tons of material delivered at the dump, or an average of 503 cars per day. This maximum output by no means taxed the plant to its capacity. With animal traction the daily output would decrease as the tunnel advances.

The daily expenses of operating by animal traction is as follows: Two dumpers at $2=$4; four drivers and swampers at $2 25=$9; one stableman, $2.50; feed, shoeing and harness of eight horses at 75 cents =$6; interest and depreciation on capital invested in horses and harness, four years, $1 25. Total daily expense of tunnel operating by animal traction, $22.75.

The daily expenses of tunnel operating by electric traction are: Two attendants at generating station, $4 50; repairs, oil, etc., $1.50; depreciation at

ELECTRIC LOCOMOTIVE, HIDDEN TREASURE MINE, PLACER COUNTY, CAL.

ten years' life of mine, $4; interest on capital invested, $3.50; cost of operating plant, $13 50; two-thirds cost of operation charged to traction, $9; the other one-third is properly chargeable to lumber, framing and ventilation, one-sixth each; two motor men, $5.50; two dumpers at $2=$4. Total cost of daily traction by electricity, $18.50; traction by animals, $22.75.

A saving also results from the shorter time required to take the shifts in and out of the mine. From the station in the tunnel it required thirty-five minutes for animals to make the trip, so that seventy minutes, or more than 12½% of the time of the shift, was lost. With electric traction the time of making the round trip is reduced to about thirty minutes, or 5%.

Taking cost of mining at 90 cents per ton by animal traction, the reduction by reason of rapid transit is 6 cents, or a saving of 7%, making the cost 84 cents. By animal traction an average of not more than 180 tons per day could be handled. The cost of material handled, then, results at $22.75 for 180 tons, or 12.6 cents per ton.

By electric traction a daily average is 378 tons at a cost of $18.50—less than 5 cents per ton.

The cost per ton by electric traction is: For mining or extracting, 84 cents; haulage, 5 cents. Total cost, 89 cents.

This shows a saving of about 13 cents per ton in electric haulage.

The Hidden Treasure is the most thoroughly and modernly equipped drift mine in California. On the opposite side of the ridge at Damascus the Red Point mine is arranging to put in a compressed-air haulage and ventilating plant.

The principal owners of the Hidden Treasure Co. have recently acquired a valuable addition to their holdings in the purchase of the Morning Star drift mine at Iowa Hill, which is herewith illustrated. The Morning Star adjoins the Big Dipper mine, owned by the same syndicate, the consolidated mines forming a valuable property.

Motive Power at the Mines.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by A. E. CHODZKO.

It is now in order to develop the subject beyond general lines, and to consider some applications of emergency plants to specific cases, such as may be found in the mining regions of California; and in attempting to do it, a clear understanding of the question at issue seems desirable.

No discussion is contemplated of the relative merits of water, electricity, or other sources of power distribution. The situation, in a few words, is this:

A mine owner has been in the past, or else intends using motive power furnished by a water or electric concern; at the same time, he wishes to protect himself against possible failure of his power supply.

Oil engines have been pointed out as the proper kind of machinery in the case, and the writer would remark incidentally, touching this suggestion, that he is in no way engaged, nor financially interested in the manufacture or sale of some particular make of oil engines.

But while refraining from individual reference, he realizes that a treatment of this subject would be devoid of practical usefulness, should any suggestions be made outside of actual results, and of such machinery as may be found, at the date of writing, in the American market; in other words, in the following remarks he has implicitly in view certain existing types of motors.

Oil engines, in their application to mining work, are not universally known, and no exaggeration exists in the statement that not a few people entertain a decided prejudice against their adoption.

These are some reasons for it:

First, the introduction of these machines in that particular field is recent, at least on the Pacific Coast; then again, the miner feels a natural recuctance to abandon the well known, time-honored steam engine or water wheel for a motor whose operation involves some unfamiliar features.

The validity of these arguments is merely a matter of time, and there is little doubt but that the man who operates a steam plant will have few reasons to complain of the change, after replacing it by a good oil motor.

It is not useless, however, to examine more closely the nature of the work which may be required from an engine at a mine.

The various applications of motive power to be met are: (*a*) Hoisting the ore and waste skips up a shaft, and incidentally baling out with a water skip. (*b*) Pumping, generally done by a direct acting pump, actuated by steam or compressed air. (*c*) Operating the air compressor for rock drilling or other purposes. (*d*) Milling, and incidentally generating current for electric light. (*e*) Ventilating —This last class of work need not be mentioned in the present case, because natural ventilation is commonly adopted in California.

All these can be classified under two distinct heads, namely: 1st—Work at constant speed, and either continuous, or intermittent at only long intervals. This includes items (*b*) (*c*) and (*d*). 2nd—Intermittent work, involving frequent starts and stoppages. To this class belongs item (*a*).

Little is to be said about continuous work; an already extensive experience has demonstrated the fitness of oil engines for this purpose. While the fuel consumption at part load is not proportional to the work accomplished, it follows it much more closely in these motors than in a steam engine, and their automatic regulation will meet satisfactorily the variations of demand for motive power.

The oil engine will therefore be well adapted to running a quartz mill of any description; the same may be said of an air compressor, whether it be used for operating rock drills, or for pumping—the latter, if done underground, becoming of course a necessary consequence of the use of oil engines. Some automatic device can readily be arranged whereby the engine is thrown in or out of gear by the variations of air pressure in the receiver, so that no novel feature will be introduced by the use of oil engines for the above categories of work, and the previous remarks also apply to Cornish pumps operated from the collar of the shaft.

In considering their adaptation to hoisting, it is well to recall two features connected with the operation of an internal combustion motor and which clearly differentiate it from a steam engine.

In the first place the former is not, by far, as responsive and easy to start as the latter. In order to set in motion a gasoline or oil engine it is necessary to turn its flywheel, by hand or otherwise, so as to produce at least one compressive stroke, and thus put the mixture of air and oil vapor in proper condition to be ignited.

Another noteworthy feature lies in the very limited range of speed variation of an oil engine; as it only has one operative stroke out of four in each cylinder, the inertia of a heavy flywheel plays an essential part in the operation of the machine, and this means that its speed cannot be reduced below a certain point.

On these two points, and as far as convenience of handling is concerned, the internal combustion motor is decidedly inferior to the steam engine, which starts or stops instantly and whose speed can so easily be controlled by the action of the throttle.

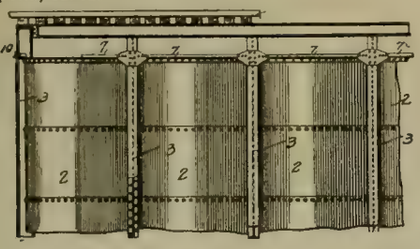
It is also evident that, while there is no reason, in principle, why an oil engine should run under or over, or in other words, while it may revolve in either direction—letting aside some practical considerations which may determine the sense of its revolutions—such a machine cannot be reversed like a steam engine; and when this is required by the nature of the work, it is customary to keep the engine in constant motion, and turning in the same direction, the reversing being done by means of a friction clutch.

Again, if a variable speed is necessary, several sets of gears must be used to connect the motor to the work, with proper appliances to pass from one to another.

These two requirements belong essentially to the attributes of a hoist, and an essential difference will be here noticed between the steam and the oil engine, inasmuch as the former is always connected to, and in control of the load, whereas in action of reversing by means of a friction clutch, or else, in passing from one speed to another, there is a moment—very short, perhaps, if it is done quickly, but yet, it actually occurs—when the load is disconnected from the engine. For any other kind of work than hoisting, no special importance would attach to that point; and even in this particular application of oil engines, actual facts demonstrate that good practical results are obtained with gasoline hoists. It may be remarked that with but few exceptions, these machines are of but moderate power; again, it will often happen that the service demanded from the hoist never requires reversing or changing speed except at the end of the skip's travel, when the load is supported in some way. But in a deep shaft, when the loading of the skips may take place at several levels, and when heavy loads are to be handled at sometimes very variable speed, and occasionally stopped in the shaft between stations, the writer does not believe that the present types of hoists actuated by oil engines would possess that degree of absolute control of the load at all moments and in all positions which is one of the requisites of deep mining. Safety depending too completely on the coolness and the quick action of a man hardly deserves its name. And since it has been assumed that steam could not be used to advantage for emergency plant under consideration, compressed air is indicated as the proper agency for actuating a large hoist of the direct acting type, exclusively used in deep mining. The function of the oil engine will be, in this case, to produce compressed air, and a few words about this subject will show that economical conditions of work can combine with safety in such an arrangement.

So that summing up the previous remarks at the present stage of the question, the writer would say that for a mine of moderate depth, where very heavy loads need not be handled, the existing types of oil motors and hoists will be mechanically well

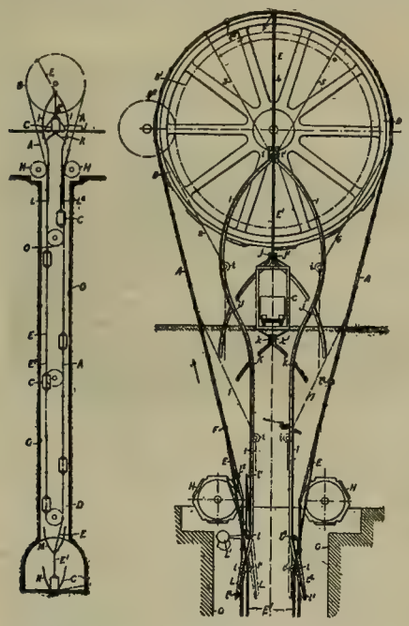
adapted to the various operations required from an engine, and that for deep shafts and heavy loads, the only exception suggested should consist in using a compressed air hoist supplied by a stationary oil motor.



(To be Continued.)

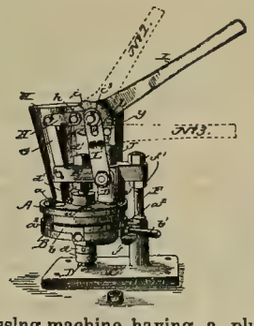
Latest Mining and Metallurgical Patents.

Patents Issued Nov. 14, 1899.



Specially Reported for the MINING AND SCIENTIFIC PRESS.

STEEL ORE BIN.—No. 636 869; A. P. Turner, Minneapolis, Minn.

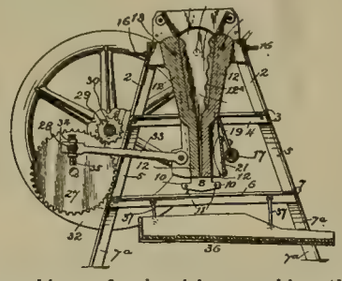


The combination in a bin, with a series of posts, held together by suitable bracing, of siding consisting of curved plates having flat portions near their edges, plates being arranged with their convex surfaces outward and with their flat portions arranged inside of and secured to posts.

RAISING OR LOWERING APPARATUS FOR MINES.—No. 637,092; D. Davy, Parkhead, England.

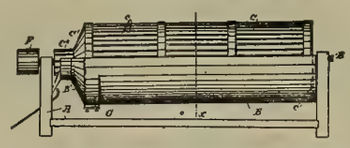
An endless-chain elevator consisting of a pair of continuously traveling endless chains passing over pulleys, a series of cages suspended by links from the chains, and curved stationary guides at top and bottom whereby each cage on reaching the highest and lowest position is diverted from the direction followed by the chains and is brought into a position midway between the ascending and descending members of the chains and is there retained during the loading and unloading of the cage.

CUPEL MACHINE.—No. 637,081; A. C. Calkins, Los Angeles, Cal.



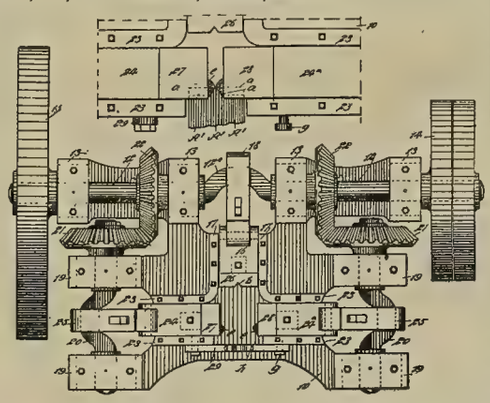
A compressing machine having a plunger and a lever joined to the plunger and having two separate fulcra-bearings, one of which is located in a slotted bearing near the plunger and comes into action during the first part of the stroke to give a powerful compression, and the other of which is located more remote from the plunger and comes into action during the last part of the same stroke of the lever to make a discharge of the object compressed by a continuation of the same stroke of the lever.

A compressing machine, consisting of a rotating disk with cells, an independently rotating false bottom, having a hole through it and connected with the disk above by a pawl, and a plunger, and plunger-guide.



A compressing machine, comprising a base with two standards *D* and *F*, the two rotating disks *A* and *B* connected together by a pawl, the frame *E* connected to the tops of the two standards and having a chamber for the plunger, the links *L*, bar *H*, and link *G* jointed, and the lever *I* with stops i i^2 and having a plunger closely connected thereto.

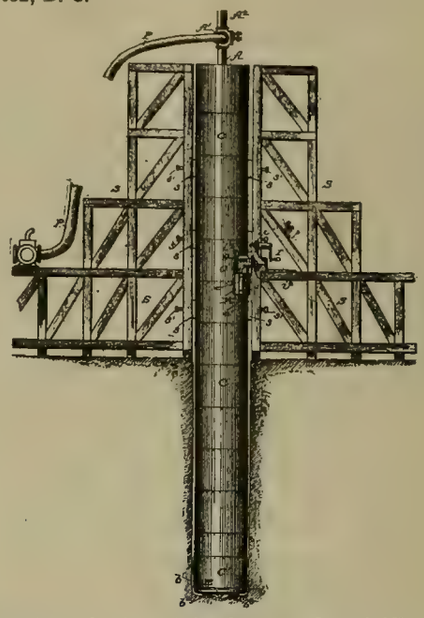
CRUSHER AND PULVERIZING MACHINE.—No. 637,076; W. B. Folsom, Salt Lake City, Utah.



In a crushing and pulverizing machine, the combination, with the oscillating jaws, each having a single top pivot, of the pivoted hangers, the tie rods by means of which and the hangers the lower ends of the jaws are connected, and the follower-roller journaled in the ends of the tie rods and hangers to make the jaws follow each other; the adjustable pivots in the top of the frame of the machine, one of the pivots being out of the horizontal plain, the crushing jaws hung only on pivots, with the lower ends of the jaws free to swing.

CLAY OR GRAVEL WASHING MACHINE.—No. 636,995; B. Horr and C. H. Gibbons, Jackson, Cal.

A device for separating gold from clay or gravel, consisting of an inclined cylinder having one end open and the opposite end made conical and provided with an extension of reduced diameter, cylinder and extension formed of longitudinal interspaced bars connecting the one with the other by means of a conical imperforate section whereby the reduced portion of the cylinder serves to separate the material which passes over the intermediate imperforate surface to the final discharge, a retaining flange c' at one end of the cylinder, means whereby the cylinder is rotated, a semicircular trough adapted to contain water and conforming to the cylinder and the reduced extension and conical portion thereof, and a well or chamber in trough proximate to the conical end of the cylinder and provided with a gate-controlled outlet.



DRILL FORGING AND SHARPENING MACHINE.—No. 637,102; W. J. Evans, Butte, Mont.

The combination with a frame, a die-actuating device on frame, comprising similar side-blocks supported to move toward and from each other, a slide-block supported to reciprocate at right angles to the other slide-blocks, all the slide-blocks working in the same plane, a cranked main shaft, cranked countershafts, rotatable at right angles to the main shaft, pitmen connecting shafts with the slide-blocks, gearing connecting the main shaft with the countershafts, and means for rotating the main shaft, of forming dies securable upon the aligned slide-blocks, an edge-forming die securable upon the other slide-block, and a bracket arm adjustable on the forward side of the frame, for support of a drill in the same plane with the dies.

In a drill-sharpening device, two forming dies, each consisting of a tenoned block, horizontally channeled across its working face, the back wall of channel being sloped to widen it toward the rear end, and a fuller projection on the lower edge of the working face of the die, and having its upright face sloped from the rear forwardly.

MINING CAISSON.—No. 637,137; A. F. Lucas, Washington, D. C.

A caisson having at its lower end a rigidly attached and closed driving head made in sections, and a central water supply pipe also rigidly connected and bearing on the lower side rigidly attached boring devices connected to and turning with the caisson about its vertical axis. Means for holding the caisson in vertical position, and oscillating devices for the caisson comprising a plate with vertical guideways rigidly attached to the caisson, a toothed and curved rackbar having corresponding sliding guides fitting those of the rigid plate, and gear wheels operating upon the rackbar, whereby the caisson is turned and is allowed to settle down without disconnecting or interfering with the gears.

PROCESS OF PRECIPITATING GOLD FROM CHLORIDE OR BROMIDE SOLUTIONS.—No. 637,140; F. W. Martino and F. Stubbs, Sheffield, England.

The process for the precipitation of gold from aqueous chloride or bromide solutions, consisting in treating such solutions with a hydrocarbon gas such as is produced when a metallic carbide is decomposed by water, and the addition of a metallic carbide to the chloride or bromide solution to produce the hydrocarbon gas in a nascent condition.

An Australian mine manager gives the following reasons for adopting charcoal as a precipitant for gold from cyanide solution in place of zinc: Charcoal precipitation gives a higher percentage of gold extraction, is more simple in the cleanup, and the treatment in furnace is more reliable. It affords safety against theft or pilfering. Charcoal ash, if stolen, is of no commercial value except to an expert, and requires a complete fluxing plant; zinc slimes do not require an expert to reduce it. Charcoal improves with exposure to air and light; zinc on exposure to air and light becomes oxidized, and fails in being so active an agent as charcoal in the precipitation of gold. Charcoal can always be obtained on the mine at a fixed price; zinc fluctuates in price and supplies are frequently delayed.

An ingenious Nevada miner has rigged up a plant for treating his refractory ore at El Dorado canyon. He crushes the ore in arrastras and then leaches it by the cyanide process in two barrels, doing all the necessary work by hand. In this crude manner he has taken out several hundred dollars the past two months. As he has no assay outfit, he is unable to keep a check upon his work, but is evidently satisfied with the result of his labor and enterprise. Such men as this will make a success of life in any country, and although this simple plant is not up to date, it illustrates the character of the American miner in the West.

ELECTRICITY is being introduced in the mining of precious stones in the far East. In Burmuh the cost of wood is becoming greater every year, and it is computed that one mining company alone saves $2500 a year by the use of electricity for various purposes.

"A SATISFIED customer is the best advertisement," but you wouldn't have the customer if you didn't advertise.

Electric Power Transmission in Colorado and Utah.

Written for the MINING AND SCIENTIFIC PRESS.

The Telluride Power Transmission Co. began operations in 1891 by installing two alternators, each 100 H. P., 10,000 alternations, wound for 3000 V. One was placed at the discharge of a flume in Ophir canyon, San Miguel county, Colo., as generator; the other at the Gold King mill, three miles distant and at 4000 feet higher elevation. The one used as generator was separately excited and compounded, while that used as a motor at the mill was self-exciting and simple-wound and had a starting motor. The apparatus provided for starting and operating consisted of a synchronizing switch, with transformer, to reduce from 3000 V. to 100 V., attached to each side; also, a synchronizer consisting of two lamps in the series connecting between secondaries of the transformers and single-pole plug switches by about 6 feet of flexible cord for breaking circuits. The starting motor was adapted to 3000 volts direct impressed. No transformers were used, except for switchboard and lighting purposes. Two wires, No. 4 copper, were used, costing about $800. Some difficulty was experienced with lightning; but, as the armatures wore off the iron or T-toothed type coils were kept on hand and attendants became expert in replacing them. About fifteen or twenty coils were lost at the two points during the first season. It is claimed the success of this plant was the first demonstration of an alternating power plant for commercial purposes.

Within the succeeding four years a larger generator of the same type was installed, additional motors were connected and the transmission distance increased to ten miles. As the number of motors operated in multiple increased, difficulties were encountered as to adjustment of field charge, dropping out of step, and inductive effects of false currents.

In 1895 two 1000 H. P. two-phase, 7200 alternations, slotted armature, closed-circuit winding generators were installed, together with an equal capacity of two-phase rotating primary, 220 V. induction motors and raising and lowering transformers of units designed to step up from 500 V., two-phase, at generating station, to 10,000 V., three phase, for line transmission and to reduce to 220 V., two-phase. The method of connecting employed in the transposition from two-phase to three-phase, and vice versa, was that known as the C. F. Scott system. The equipment for protection against lightning was the A. J. Wurtz non-arching metal type, and consisted of six choke coils in series, each containing 94 feet of underwriter's wire. From the line terminal of each choke coil a ground shunt was carried through four units of type "C" porcelain encased arresters The line, as equipped for 3000 V., employed tripple petticoated glass insulators. So little difficulty with lightning has been met with that the danger from that source has been almost forgotten. The hydraulic plant consists, for one generator, of three miles of flume from Trout lake, being 2600 feet of 16, 18 and 20-inch pipe, delivering water to a 32-inch Pelton wheel under 860 feet head; the other generator is driven by a 32-inch Pelton wheel, propelled by water from a 2000-foot line of 18, 20, 22 and 24 inch pipe, under 580 feet head.

From 1895 to 1897, by an arrangement between this company and the Westinghouse Electric & Mfg. Co., a series of experiments were carried on in connection with this plant, with the purpose of making demonstrations of transmission longer distances at higher pressure. Generators of different frequency, and equipped with different types of armature, were installed. Two transformers, 100 K. W., so designed as to give potential of from 10,000 to 75,000 by frequent steps, and so arranged as to be adjustable, were installed at opposite ends of the transmission circuit of the original plant, three miles in length. Subsequent experiments were made to determine how high a voltage could be commercially employed and under what conditions, and as to various transformer requirements, etc. Readings were taken designed to show the effect of frequency, wave form, self-induction and capacity, distance between wires, arrangement of wires, atmospheric influences, altitude, etc. Potentials were employed reaching as high as 140,000 V., these being conveyed over the three miles of line and upon insulators of all the different types and in all sorts of weather.

At the close of these experiments—July, 1897—the Telluride Power Transmission Co. began the development of water power in Provo canyon, Utah, installing there an electric plant of General Electric generators of 1000 H. P. units. These machines are "star" wound, three-phase, 50 cycle, 800 V., slotted armature. The transformers were designed by the Telluride Co., being constructed in the shops of the Wagner Electric Co. of St. Louis, Mo., under the supervision of V. G. Converse. They are "star" connected in both high and low-tension winding, and the centers of the stars are directly grounded, being of the multiple coil, self-cooling, oil-immersed type. The insulation used is untreated cotton and treated fullerboard, the oil being the 300° test. The transmission is at 40,000 V., three-phase, and for distances of thirty-five to fifty miles. The line construction employs a single 7-foot crossarm, attached sufficiently low upon the pole to accommodate two wires, the third being carried out at the top of the pole. The equilateral triangle thus formed gives 76 inches between wires. Motors of all types, both two-phase and three-phase, are operated, varying in size from 1 to 250 H. P. Preference is now given to the three-phase system throughout, and star connection of transformers, where same are used in connection with high-tension, long-distance transmission. Where transformers are used on distribution circuits at 5000 to 10,000 V., the mesh or delta connection seems to be preferred.

Upon test, the thirty-five-mile line, with three No. 4 copper wires, showed electric static capacity of between 3½ and 4 amperes, the radiation loss in fair weather amounting to less than 7 K. W., which, added to C^2R of the line, gives a net transmission loss of less than 5% of the 100 H. P. transmitted over this particular line.

In the Great Basin of Nevada.

Upon the highest table lands of the Great Basin is situated the county of Elko, in Nevada. It contains 10,972,000 acres of land. The Ruby range of mountains, which divide the Salt Lake and Humboldt divisions of the Great Basin, are the highest in the county. They are steep and precipitous, with huge granite crags, bluffs hundreds of feet high jutting over narrow canyons, inaccessible peaks and mountain torrents that furnish the water supply to fertilize the plains below. The other mountains are lower in elevation and their rough edges are worn off by erosion, presenting smooth, rounding outlines and covered with soil and grasses from base to summit. On some of them are forests of cedar, juniper, nut pine and mahogany. Most of the mountains are rich in minerals, though the country has never been thoroughly prospected and but few mines are developed extensively. One mineral belt, extending east and west, is about 40 miles wide and 130 miles long in the county. For this distance gold, in both placers and ledges, has been found in paying quantities. Silver mines have been worked continuously since first discovered. The first discoveries of mineral were made about the time it was becoming known that gold existed in other places than California, and men were led from place to place by stories of rich strikes. Early in the '60s the first placer mines were found, and in a short time the country was swept over by a wave of prospectors. Disappointed at not finding the country as full of the yellow metal as they expected, and allured by stories of rich diggings elsewhere, most of them left the country as soon as they entered it. A few ledges containing gold and silver were worked, and thus quartz mining commenced; but this was too slow a method for gold hunters. The tide of prospectors ebbed from the country, leaving unprospected claims, abandoned shafts, half constructed ditches, caving tunnels and mountains filled with minerals for those who may in the future make better use of them. Of the mining districts in the county, Tuscarora stands at the head, being one of the first discovered, and it has been worked continuously ever since. Placer mines were first found there, and are still being worked. Silver ledges were developed, and have turned out $10,000,000 worth of silver. More recently the gold ledges in the district have been opened and are being profitably worked.

ELKO AND TUSCARORA, NEVADA.

Palladium in South Australia.

The numerous discoveries which have been made recently in various parts of South Australia, of tellurium, associated with gold in auriferous ores, says the London *Mining Journal*, have induced assayers and mineralogists to give a little more attention to the detection of the various metals which accompany gold in ores. At the end of August last, the assayer at the Mount Torrens ore crushing works, while examining some ores from the Mount Torrens district, noticed an unusual mineral in them. After careful testing he found that it contained the rare metal palladium. Assays yielded 17 ounces 6 dwts. 11 grains palladium, and 16 dwts. 21 grains gold per ton.

Palladium is a light-colored metal intermediate between the grey of platinum and the white of silver. It is generally found in small, flattish grains which have a tendency to exhibit a fibrous, radiated structure. Palladium is chiefly found in alluvial deposits accompanying gold and platinum. Metallic palladium has a hardness of about five—that is to say, it is as hard as platinum. It is not so ductile as platinum, and is soluble in all the strong acids. It is unique in its power of occluding hydrogen, which it does to the extent of nearly 1000 volumes, forming the alloy Pd_2H. Palladium is used for making graduated circles and scales for scientific instruments, for plating certain silver goods, and to a small extent in dentistry. The French Government are said to possess a highly polished cup made from pure palladium, which weighs over three pounds. Palladium was named, in 1804, by Wollaston, after the asteroid Pallas, which was discovered in 1802 by the German astronomer, Henrich Olbers. Metallic palladium is at present worth about £112 per pound.

IN the manufacture of carbon steel microscopic diamonds are formed. A number of steels from a variety of processes have been examined and gave identical results. A piece weighing 300 grammes was cut from a lump of steel and treated with nitric acid; the insoluble residue collected was mainly graphitic carbon. After being washed with water, it was boiled three times with fuming nitric acid, which partially dissolved the residue; hydrofluoric acid and then fuming sulphuric acid, were used. There then remained nothing but graphite, which, after being washed, was melted with chlorate of potash. This long series of operations was recommenced, because it was necessary to subject the residue to all the treatments mentioned. The insoluble residue obtained fell to the bottom of a vessel filled with iodide of methylene, and the little transparent octahedrons visible through a microscope burned on a sheet of platinum without leaving any ash. These were the diamonds.

The Walls of Mineral Veins.

Written for the MINING AND SCIENTIFIC PRESS.

There is much diversity of opinion as to the relation of mineral veins and ore deposits to their walls. Some cling to the lateral secretion theory of which Dr. Sandberger was a firm adherent, but in more recent years there is a general tendency to the belief that the source of the metallic and other contents of mineral veins were derived from great depth, and that the walls of the vein have practically no effect upon ore deposition.

A mineral vein traversing rocks of unlike character would be most likely to substantiate the lateral secretion theory, as it is scarcely reasonable to expect that two rocks of wholly unlike composition, as, for instance, diabase and clay slate, would contain equal values in gold, silver, iron, lead or copper, presuming that the minerals found in the veins were derived from these wall rocks. Their difference in structure and in composition suggests that the vein would be effected thereby. Structurally this is found to be the case, for in the slates the vein is usually characterized by a banded structure, the inclusion of more or less of the slaty material, and the semi-silicification of slaty portions, while in the diabase the vein usually has a more massive appearance, the banded structure being generally lacking. As to the values contained in either case, it is not apparent that the character of the wall rocks have an influence on them, for we find beautifully banded veins in slate with merely a trace of value in gold and silver, with a small amount of sulphides which are also low grade, and we find similar appearing veins in black slate running into the hundreds of dollars per ton in gold. In the massive veins in greenstone similar conditions are observable. Clean massive white quartz is found practically barren of values and again matted with gold, and these variations may often all be found in a single mine.

The Rosario mine, on the high Plazuelas mountains above San Jacinto, a few miles from Cantarranas, in Honduras, offers an illustration of vein formation in two distinct rock formations. The country rock consists of an intensely hard metamorphic black clay slate, through which courses an infinite number of veinlets of calcite and quartz. This rock is intruded by a greenish gray eruptive—rhyolite. The Rosario vein is partly in the slates and partly in the rhyolite, and is in no sense a contact vein. The contact of rhyolite and slate is not always sharply defined, the slate having been torn into fragments along the edge of the intrusion and the pieces included in the magma of the rhyolite with much consequent alteration.

The vein occupies a fault fissure which cuts alike through sedimentary and eruptive rock, and in places are found indications that the fissure was, in part, an open crevice, as evidenced by a beautifully banded structure. It has a straight general course, though with many local flextures and bends. It varies greatly in width, from a foot or two to upwards of 20 feet, the best ore being usually found in the swells of the vein.

The wall rocks are the black slates in part and in the lower levels extending under the mountain wholly in rhyolite. The gangue is quartz, the values being in both gold and silver associated with the ordinary sulphides of the base metals, copper, lead, iron and zinc. A peculiar feature of this vein is its tendency to split into two veins, the foot wall vein being usually the richer, through in the larger or better ore bodies the two veins are essentially one.

The mine has been very extensively developed but it does not appear that the character of the wall rocks—so wholly unlike—has had the slightest influence on ore deposition, for equally rich ore has been found in those portions of the vein in the slates and also in the rhyolite. Ore is scattered along this fissure for thousands of feet and thousands of tons have been mined and milled, but, as stated above, as yet there is not the slightest evidence to indicate that the ore was derived from the wall rocks or that the character of the walls in any manner affected the ore deposition. Another fact of note is that the wall rocks of the Rosario mine are practically without mica, augite or hornblende, and these Prof. Sandberger considered essential to the secretion of valuable minerals from the walls, being, in fact, the mineral constituents from which the vein values were derived.

In the early development of the mines of Leadville, Colo., the character of the ore deposits was quickly recognized as belonging to that order of mineral veins known as contact deposits. Dr. S. F. Emmons, examining these deposits, expressed the belief that the mineral constituents were derived from the overlying porphyry. Mr. Emmons' conclusions as to the origin of the Leadville ore deposits were as follows:*

I. That they were derived from aqueous solutions.

II. That these solutions came from above.

III. That they derived their contents from the neighboring country rocks.

IV. That in their original form they were deposited not later than the Cretaceous epoch.

And as regards their mode of formation:

I. That the metals were deposited from their solutions mainly as sulphides.

II. That the process of deposition of the vein material was a chemical interchange, or actual replacement of the rock mass in which they were deposited.

III. That the mineral solutions or ore currents concentrated along natural water channels and followed by preference the bedding planes at a certain geological horizon, but that they also penetrated the mass of the adjoining rocks through cross joints and cleavage planes.

And with regard to their distribution:

I. That the main mass of argentiferous lead ores is found in calcareo-magnesian rocks.

II. That the silicious rocks, porphyries and crystalline rocks contain proportionately more gold and copper.

Dr. Emmons believed that the values in gold, silver, lead, iron and copper came from the overlying porphyry. He also recognized the occurrence of intrusive dykes which cut up through the mineral-bearing formations, and that they seemed to favor the concentration of rich masses of ore in their vicinity. Concerning a prominent dyke cutting through Fryer Hill mines he said: "It is supposed to have acted as a dam, causing an interruption of the ore currents, the stagnation thus produced having influenced a first deposition on its northeast side, leaving a barren portion immediately under its southwest side, but through the gaps the currents passed, slowly depositing as they went, and in the eddy beyond was formed a second accumulation of ore."

This was in the early days of mining in Leadville. Chas. M. Rolker and others, having the advantage of later development, did not agree with Mr. Emmons, that the ore-bearing solutions came from above, but thought that they came from below, following the fissures occupied by the intrusive dykes of the region. In some of the mines over considerable areas a dolmitic sand or solid limestone was found lying between the ore bodies and the overlying porphyry. The very extensive development of recent years has shown that the ore deposits were not confined to a single horizon, as was at first supposed to be the case. Throughout the Leadville district the conditions are much the same as to the character of the rocks lying above and below the ore bodies and it has not yet been demonstrated that these wall rocks have any appreciable influence upon ore deposition.

Compressed Air in Mines.

It is a mistaken idea among mining people that compressed air is one of the most wasteful forms of mechanical energy. Yet it is upon the use of this force that engineers will be compelled to depend when they are asked to mine at depths much below those which are now considered as within the range of practical management, says the *South African Mining Journal*. If the use of compressed air is to be continued under conditions of less waste, in order to make this advance probable, it is obvious that the mining intelligence must be brought to bear upon the subject with more persistence and determination to achieve better results than has hitherto been the case. It is necessary, before discussing the matter, to lay down the self-evident axioms, yet so much neglected, that (1) compression must be done on clean, dry, cool, prepared air, and (2) expansion must be conducted without any undue loss. It appears from the practise of several mines that it apparently does not matter what kind of air is supplied to the compressor: "anything will do;" nor does it seem necessary to the buyers to consider what losses are made through imperfect air valves; air pipes reduced in area, thus choking the flowing air; fractures of mains by falling rock, or through imperfect joints that tend to form "whirls" and "eddies" through the existence of projections or recesses in each joint. It would certainly appear to be false economy to use light air pipes if dents, rents, and loss accompany the use of such pipe lines. All pipes, joints, fittings and valves should be internally smooth, "easy" bends where change of current direction is made. No one disputes the value of a reheater for heating below ground the air admitted to the drills, etc., yet the reheater is not generally adopted. It should not be impossible, if the air mains were properly designed and installed and all other points seen to, to obtain at a depth of 6000 or 7000 feet below the surface an efficiency very little below the surface efficiency. With the general adoption of double stage winding from great depths, the first lift on the incline of the ore bodies will be performed by the compressed air hoist. In this connection it will not be inadvisable to call attention to the points which many earnest men have been urging in various parts of the world with some measure of success. These are as follows: (1) The supply of clean, dry, cool, prepared air to the compressor; (2) the use only of the most economical engine to supply H. P. at the lowest total cost per I. H. P.; (3) the use of the best form of air valves and fittings to provide against frictional losses; (4) the use of smooth, regular, tight air mains of correct size; (5) the use of the reheater. These are matters which must not only be considered when installing the plant, but about which a constant supervision must be exercised if a high efficiency is to be maintained.

The Uncertainties of the Adaptability of Cyanide Treatment.

The first cyanide plant built in Montana was erected at the Revenue mine, in Madison county, by R. R. and F. B. Turner. Ordinary milling methods had absolutely failed to extract the gold from the ores of this mine, even when fine crushing, grinding in pans and pan amalgamation followed by concentration were resorted to. The ore yielded its gold readily to cyanide treatment, however, even with comparatively coarse crushing.

This plant is still in operation. Its capacity has been increased from time to time till it now handles seventy tons per day. In Fergus county, commencing on a small scale, the Gilt Edge mill has grown to a capacity of 140 tons a day.

Since then improvements have been made in the application of the process, particularly in the handling of material, in the solving of mechanical problems and the extraction of gold with solutions of much less strength than were at first employed. A series of exhaustive experiments have also demonstrated that ores which were at first considered unadapted to the process are now easily treated by it, showing that great improvement has been made in the chemistry of the process.

In every gold mining section are found some ores adapted to the cyanide treatment, but without tests it is impossible to tell what ores can and what can not be satisfactorily treated by cyanide. As a rule, it may be said that oxidized ores are more readily amenable to it than sulphuretted ores, but to this general proposition there are notable exceptions. One of the latest installations in Montana is that in Jardine, in Park county, which is being built to treat arsenical sulphide gold ores in the form of concentrates which were previously supposed not adapted to this treatment.

Concerning the treatment of a certain sulphide ore, Matt W. Alderson, of Sheridan, Montana, says:

"A few months ago a sample of pyritic ore was left at my laboratory to be tested as a possible good cyaniding ore. Having no idea from its general appearance that it would be amenable to cyanide, nothing was done with it for some time. When tested, however, the consumption of cyanide was found to be light and a fair extraction was secured in a short time. Investigation followed, and it was found that the ore would range in value from $4.50 to $9 per ton. It was, supposedly, a concentrating ore, but it would only concentrate two or three into one, so the concentrates were too low in grade to stand expense of shipment and smelter charge, let alone leave anything for mining and milling. Subjected to direct treatment by cyanide, a way was found whereby a working extraction of over 90% could be depended on. Ores containing little gold and such an amount of copper and lead as to make them valuable for these metals would better be sent to the smelter. Test the ore—that is the only way to tell—and if results of the tests are not satisfactory they will not be conclusive. Ores are successfully cyanided to-day that a few years ago seemed to offer insuperable objections to such treatment.

"Ways will be found to render ores amenable not now believed to be so. Solutions containing much less cyanide will be used. In some places solutions containing eight or ten pounds of cyanide per ton are now used. This is entirely unnecessary in very many instances. A few years ago it was held that satisfactory precipitation could not be secured by the aid of zinc from solutions containing less than two and one-half to four pounds of cyanide per ton. To-day we know that as perfect precipitation can be obtained from solutions containing one-half pound of cyanide per ton as from those of any greater strength, and results secured from Silver Star this past summer would indicate that even this amount is not actually necessary. I think the greatest improvement will be in reduction in the cost of treatment, still further advancing the process which, though younger than any other, has no rival in either economy or efficiency in the treatment of refractory ores."

In Lewis and Clarke county, Montana, the first successful work was on tailings from the mill at Gloster. That was the beginning of the work in the Marysville district, where the present output runs into the thousands of dollars per annum. More slimy material—tailings which could not be handled by the more generally adopted percolation method—was treated in Montana the past summer than in all the rest of the United States put together. The cyaniding output last year was nearly double what it was the year before. This year will show a vast increase over last and new plants under construction will swell still further the revenue from this source in the future.

The Mount Morgan Mine of Queensland.

Australia's greatest gold mine is located in Queensland. It was discovered by cattle men who, not realizing its value, sold it for a nominal sum. It was located in a desert-like country, and at the time of its discovery was far from communication with the settled parts of the country nearer the coast. A recent review of the changes which have taken place at Mount Morgan, with a description of its present condition, written by Edgar Hall, appears in the Australian *Mining Standard*, an abstract of which is herewith given:

The writer recently visited the Mount Morgan mine after an absence of eight years. He knew that great alterations had taken place, but was not prepared for the almost revolutionary changes which he found—changes embracing every department of the mine, and, happily, for the better. Formerly one reached the mine over a road of the worst possible description; now the railway takes one to the township, and the mine is connected by a branch line. This forms the keynote to the alterations all through; the management of the mine is changed. Old men and old ideas have given way to young men and new methods, and the place has been transformed by the skill and ability of a properly trained and organized staff of officers.

The early management at Mount Morgan was a glaring example of the waste and extravagance often accompanying extreme wealth. The mine was big, but everything else was petty except the dividends. Now the general manager is assisted by a staff of professional men, most of them young and graduates of a mining school, organized into a system of departments, each of which is responsible for its own work alone. The general manager—G. A. Richard—has communicated his own enthusiasm and energy to his staff, and they on to the workmen.

The changes in the mine are not so remarkable as in the treatment of the ore. Externally, one sees a difference due to the extension of the open-cut system and to the removal of so much ore. The improvements consist mainly in the introduction of labor-saving devices for handling the ore and in a system of tunnels and drives for development and access below ground. A main shaft is being sunk to open the mine below the lowest tunnel, and is furnished with winding engine capable of sinking the shaft to a depth of 1500 feet, *i. e.*, over 2000 feet below the top of the hill and surface of the deposit. This engine is driven by compressed air.

A large and increasing amount of mundic ore is being mined; and as the stopes are now well below the level of oxidation, theories can be applied direct to the facts. The facts have proved rather bad for some of the theories.

A result of the climatic conditions prevailing in the Queensland locality in which it is situated, and the extent of the superficial deposits, is evidence of the long continuance of similar climatic conditions to those now obtaining. Those conditions were assisted in their decomposing effects upon the huge pyrites deposit by the fact that at one time the deposit had been intersected by dykes of dolerite, which rapidly decomposes under atmospheric influences. Dolerite and pyrites decompose rapidly enough when separate; but, standing side by side, they help each other, the acid products of the pyrites acting upon the basic dolerites, and thus was produced surface decomposition of more than ordinary intensity, and the products of that extra rapid decomposition formed the ever-varying mixtures of material which once covered the crest of Mount Morgan.

Along the junction of the oxidized and sulphide ore the decomposition of the latter can be seen in all stages, passing from a cellular, slightly brown quartz to hard pyritous rock quite unaltered. In the intermediate portions the pyrites is seen lying loosely in cavities in the quartz. Of two specimens, taken at a distance of 15 inches apart vertically, one is a cellular lump of quartz and silicified country rock, containing no pyrites, but having the cellular spaces partially filled with a soft brownish material, which looks like a magnesian mineral. The other is white quartz, speckled with pyrite crystals, many of which are loose; in this lump are portions free from pyrite, which look like an altered feldspathic rock. Both lumps have the smell peculiar to the action of sulphuric acid on clays and feldspars. Within a space of a few square yards a great variety of decomposition products can be seen, and all the openings in ore give evidence of rapid oxidation in the efflorescence of sulphates of lime, magnesia, iron and copper existing everywhere. Veins of satin spar, which have been formed in this way, occur, filling cracks and fissures, and are still forming, and in a few places possess an emerald tint, due to the presence of copper. The irregular association of kaolinic material with silicious and iron ores, which seemed so extraordinary in the upper levels of the mine, is now easily explained.

The dykes that have intersected the Mount Morgan lode have penetrated in erratic manner, and in the lower levels of the mine masses of country rock and ore can be seen entangled in arms of dolerite of all shapes and sizes. In places it is hard to tell at first glance which is ore, dolerite or country rock. No simple fissures took place here, but a tremendous crushing in several directions, forming numerous irregular openings, into which rushed the probably very fluid, basic lava now forming the dykes. The weathering of such a mixed mass would produce the curious blending of the Mount Morgan gossans and so-called sinters, and lead to local peculiarities of form, in which the fanciful could easily see funnels and basins, bombs and boulders. One of the features of the new Mount Morgan is a perfect series of mine plans kept plotted up to date, showing the network of dykes which intersect the ore body. These plans will possess, as the mine development progresses, a high scientific value to the student of ore deposits. The size of the great ore body is well maintained, and it is satisfactory to know that there is no falling off in value, ore being found at the lowest point reached and going underfoot as rich as ever was found above.

Regarding the reported existence of tellurides in the mine, Mr. Richard says that while no large quantities of tellurides have been detected, almost all of the ore will give reactions for tellurium. Much as the appearance of the mine has changed, the metallurgical department shows still greater changes. The method of treatment is still that of chlorination, but, though the same in principle and involving the same chemical reactions, yet the mode of application has so altered as to make the present system almost a new process. By the former system, the ore was crushed dry in rolls, calcined in small hand reverberatories at a heat too low to dehydrate the kaolin; then chlorinated in barrels, the gas being generated under slight pressure, the gold chloride leached out by water and the gold precipitated on charcoal. Although the plant was in the aggregate the largest chlorination mill in the world, yet the separate units —furnaces, barrels and filters—were all small, involving an immense amount of labor and supervision, to say nothing of the loss by leakage, waste and imperfect extraction at each of the many parts of the whole. The chlorine is now applied to the roasted ore as a solution in water, the method being similar to ordinary cyanide and hyposulphite lixiviation, in that the solvent flows on to the ore contained in large open vats, and, in filtering through, dissolves out the gold. This improvement renders possible chlorination on a gigantic scale. The economies are: in chemicals, cheaper chlorine and less waste of gas in dealing with large charges; in power, the expensive revolving of the barrels is done away with; in skilled supervision, only the same care and attention is required by a very large vat as was required formerly by each separate small vat; in labor, the calcined ore passes direct to the vats, where it remains until it is discharged as tailings.

In the calcining department the improvements have been in the same direction of increased size of plant. For the oxidized ores large revolving calciners, discharging continuously, are now employed; while for the pyritic ore the general manager has invented a roaster. Metallurgists know that in nothing do ores vary more than in their capacity for resisting oxidation. A roaster which suits admirably a certain ore or the requirements of a certain process may be, and often is, very inefficient when applied to other ores and other processes. The Mount Morgan ore, though carrying on an average only 15% of pyritic minerals, is difficult to roast dead, and, as in other chlorination methods, a very perfect roast is required for good extraction and economy of chlorine. This the Richard shaft furnace seems to effect better than any other. The ore is dry-crushed in ball mills, then roasted in four large shaft furnaces, cooled and passed automatically to the bins. From these it is trucked to the vats, where it is leached. The vats are large, oblong tanks of concrete and cement, 4 feet deep, with a filter bed of gravel and sand at the bottom. The chlorine is generated from manganese dioxide, sulphuric acid and salt, in stills in the ordinary way, then absorbed by water contained in large cement-lined and covered tanks. From these tanks the chlorine water is conveyed in earthenware pipes and applied direct to the calcined ore in the open vats. The gold-bearing solution is then passed through charcoal filters. Every part is designed for large tonnage. The tailings are removed from the vat by a mechanical shovel. If the expectations of its designers are realized, they will show that, for gold ores which require roasting, open-vat chlorination, as practiced at Mount Morgan, is cheaper than cyanide treatment.

Translucent Paper.

There are several methods of rendering paper transparent. Coat white paper with a solution of Irish moss in water, to which a slight quantity of previously dissolved gelatine has been added. It should be applied hot to the paper. When colors are desired they must be transparent; they must be ground in varnish, and a stronger varnish is required than for opaque colors. A fine yellow may be produced by using yellow lake and red sienna. These make a warmer color than the yellow lake alone. If cost is no objection, aurasine may be used. For pale red, madder lakes should be employed, but for darker shades crimson lakes and scarlet cochineal lakes. The vivid geranium lake gives a magnificent shade, which, however, is not at all fast in sunlight. The most translucent blue will always be Berlin blue. For purple, madder purple is the most reliable color, but possesses little gloss. Luminous effects can be obtained with the assistance of aniline colors, but these are only of little permanence in transparencies. Light transparent green is hardly available. Recourse has to be taken to mixing Berlin blue with yellow lake or red sienna. Green chromic oxide may be used if its sober, cool tone has no disturbing influence. Almost all brown coloring bodies give transparent colors, but the most useful are madder lakes and burnt umber. Gray is produced by mixing purple-tone colors with suitable brown, but a gray color hardly ever occurs in transparent prints. Liquid siccative must always be added to the colors, otherwise the drying will occupy too much time. After the drying the paper must be varnished on both sides. For this purpose a well-covering, quickly-drying, colorless, not-too-thick varnish must be used, which is elastic enough not to crack nor to break in bending.—English Mechanic.

An Automatic Pump Governor.

To the Editor:—I noticed in "Concentrates" of November 11th a method of starting and stopping a steam pump in shaft sinking by wires, and it called to my recollection an automatic steam pump which was arranged by my engineer, and which worked most successfully.

In this case it was required to lift the water from an upper level, where at that time very little work was done, and consequently only most occasional observations could be made of the operations, and that, too, by miners unskilled in the mechanical arts.

The arrangement was so simple that it seems incredible that it has not come into more general use where a moderately small quantity of surface water is to be separately handled.

The pump was an ordinary horizontal bed Dow, operated by a steam globe valve. To the wheel of this was attached a crank lever, the other balance being a float, resting on the water in a sump, in which was also placed the suction pipe. As the opening of valve was limited by the crank, there was no danger of the pump running at too high a speed should the sump have more water than would raise the float to its maximum. For weeks at a time the only care the pump required was to see that the oil cups were filled, and this was attended to, once each shift, by one of the miners.

Though I was using three steam pumps, one of them in sinking besides the other necessary engineering work for the hoist and 10 stamp mill, I had only this one engineer; and the operations of the entire plant worked as smoothly as I ever saw it in other mines with a pump man on each shift, in addition to the mechanical head of the department.

W. J. Adams, E. M.

San Francisco, Nov. 17, '99.

The First Patent Issued.

In strong contrast with the present system of the United States Patent Office, where every inducement tempts those with inventive faculty to produce some new and useful device, is that of the issuing of the first patent, concerning which *Iron and Steel* says: To the General Court of Massachusetts belongs the honor of granting the first American patent. This was in 1648, and was then designated as a monopoly. It was confined to the region controlled by Massachusetts, and the one issue apparently included all the inventions of the inventor connected with engines that depended upon water for their motive power. The limit of the monopoly was fourteen years, and the court not only retained power to forbid exportations, but to prevent exorbitant charges upon the public for their use. The patent was issued in this form:

"At a general Courte of Boston the 6th of the 3th Mo. 1648. The cor't consid'inge ye necessity of raising such manifactures of engins of mils to go by water for speedy dispatch of much worke with few hands, and being sufficiently informed of ye ability of ye petition to perform such workes grant his petitioner (yet no Other persen shall set up or use any such new invention, or trade for fourteen yeares without ye licence of him the said Joseph Jenkes) so farr as concernes any such new invention, & so it shall be alwayes in ye powr of this co'te to restrain ye exportation of such manifactures & ye prizes of them to moderation if occasion so require."

This inventor, Jenkes, or Jenks, as it would now be spelled, came from Hammersmith, England, settled in Lynn in 1643, and died in 1683, aged eighty-one. He was a blacksmith and machinist, made the dies for the coining of the "Pine Tree" money, and built the first fire engine in this country; altogether a man of great inventive genius and the ancestor of a large number of descendants. One of his sons removed to Rhode Island, where he built several mills.

Mining Summary.

ALASKA.

The J. S. Kimball Co, a San Francisco shipping concern, has a scheme to take beach sand in ballast from Cape Nome and have it treated for gold in San Francisco The steam schooner Aloha was the first to try it, and carries fifty tons of beach gravel ballast in her hold.

The Alaska-Mexican mine reports for the month ending Nov. 4th 12,881 tons ore crushed, returning $17,808, and 311 tons sulphurets, valued at $7175. Gross yield, $27,339; expenses, $18,928; average of ore, $2.12.

The Alaska United mine reports 24,777 tons ore crushed, yielding $39,546, and 657 tons sulphurets saved, valued at $15,111. Ore averaged $2 40 per ton. Gross yield, $59,564; expenses for month, $37,111.

The beach deposit of gold to the west of Cape Nome is an unsolved problem. By some it is claimed that the gold in the sand has been washed out from the tundra by the waves at high tide and deposited through hundreds of years in the sand. It is found from 2 to 5 feet below the surface in the drift. There are some who claim that the gold is washed in from the sea, and that the real field —the "mother lode"—is to be reached and developed by dredging. The beach to the east of Cape Nome makes no such showing. Copper plate for use in rockers is worth its weight in silver, and one miner who had no copper substituted silver dollars for it, sixty-four of them being required to properly plate his rocker, which, added to its first cost of $20, made it expensive, even for this locality. Labor in the mines this season was worth $8 to $10 a day.

On Nov. 1st communication with the outside world was completely shut off for seven months, and only a few of the people now in the Cape Nome district are fixed with either food or shelter from the severity of the climate, though those who are prepared with houses to live in and sufficient food and fuel may pass the winter comfortably. There are very few so well off, fuel being scarcer than food. Parties of four, six or eight have organized for winter operations by securing a large tent, spreading it on the beach on the ground they propose to work in, and stoves kept going to make the tent comfortable to live and work in.

As far above as Cape Prince of Wales, 235 miles, gold has been found along the creeks in quantities that would pay from $10 to $50 per man per day if panned by an expert.

Claims are offered for sale—a claim being twenty acres—at prices from $50,000 to $150,000. Over 1000 claims, covering 20,000 acres, about thirty square miles of territory, have been recorded, and it is expected that each claim will represent a lawsuit.

Nome gold is darker in color than the gold of the Yukon river country. The current trading price is $16 an ounce. Gold dust and nuggets constitute the bulk of the currency, and go'd scales are as necessary in the stores as the ordinary grocer's scales. Gold dust as a circulating medium is not popular, for coin or paper money commands a premium of 7%.

Winter in the Nome district ordinarily continues from October to June, and a temperature of 50° to 60° below zero is not unusual. On Dec. 21st the sun barely rises above the horizon, and on June 21st it does not disappear entirely from sight during the twenty-four hours.

ARIZONA.

GILA COUNTY.

The Ray Co. is doing a large amount of work. In addition to the development of the mines, the construction of the grade for a railroad from the mines to Kelvin, on the Gila, is in progress. The smelters of the Ray Co. will be located at Kelvin and will have a daily capacity of 800 tons. Machinery and supplies are to be hauled from Red Rock station to the Gila river by a traction engine.

GRAHAM COUNTY.

It is reported that W. J. Parks has struck 3 feet of gray copper ore in his claim on Kelly creek, eight miles from Solomonville. It was found in a large vein of hematite. The ore will be shipped.

MOJAVE COUNTY.

(Special Correspondence). — The Tennessee mine at Chloride is shipping a car of concentrates per day, the values therein being gold, silver and lead.

The Elkhart mine and mill are operating. The shaft is being sunk to the 500 level.

It is expected the railroad, whose present terminus is at Chloride, will be extended to the White Hills, thirty miles farther northward.

Chloride, Ariz., Nov. 16th, '99.

YAVAPAI COUNTY.

The Bauman copper group, east of the old Bowers ranch, on Agua Frio, are to be prospected with diamond drill. There are some good prospects on the property. A shaft sunk several years ago by J. Lawler shows values in copper and silver, and there are small bunches of high-grade copper ores found at several places on the property. The rock formation is schist and limestone intruded by dykes.

K. Barrett, of Castle Creek district, reports that Thomas Farish is working thirty-five men on the Whipsaw properties. The Swallow people are sinking a shaft and drifting 500 feet to cut the ore body in another mine. They have 3 feet of high-grade ore. An electric hoist has been put in at the Copperopolis mine. Across the hill from these the Alger people at the Dr. Jones mine are awaiting the arrival of a hoist.

Prescott *Prospect*: J. Hise has let a contract on the Jackson mine, near Placeritas, for 700 feet of sinking and drifting. He contemplates erecting a 20-stamp mill.

YUMA COUNTY.

As a result of a run of eighteen days the King of Arizona gold mine recently shipped $24,000 in bullion.

CALIFORNIA.

Amador.

The South Eureka mill, near Sutter Creek, has been closed down owing to lack of electric power. Contracts to drift north and south on the 1800 level are to be let.

The Fremont Con. mine, near Amador City, comprising the Gover, Fremont and Loyal Lead, is to be operated more extensively than ever before. The machinery is being rearranged and additions made to the plant. The Gover workings are over 1000 feet deep. There is a large shoot of low-grade gold ore in the lower levels.

A crushing of ore from the Central Eureka ran $100 per ton. On the 1500 level the vein is 30 inches wide and rich in gold. It is thought to be the shoot which extended into the adjoining Badger and Eureka mines.

At the Bunker Hill mine, north of Amador City, preparations are being made to reopen the property, which comprises the Bunker Hill and Mayflower mines. The Mayflower mill was at one time equipped for barrel chlorination by the Mears process. It is the only barrel chlorination plant in California.

Butte.

The Cherokee mine at Cherokee is reported sold to Eastern people. The property comprises 1500 acres, of which 150 acres have been hydraulicked to bedrock. The bank is 500 feet high. On and near bedrock the gravel is cemented and has to be blasted. The Pittsburg men have not yet put up the entire purchase price of the Cherokee mine, but the sale is considered as being a surety. When operations begin it is expected that 200 men will be employed.

Calaveras.

The Fellowcraft mine at San Andreas has been inspected recently by northern California men with a view to resuming operations.

In the Ford mine it is reported that $50 ore has been found on the 100 level in the foot wall. When sinking the north inclined shaft near the 100 level numerous small seams of quartz were found cutting the black slates of the foot wall and these small veins were very rich in gold and tellurium. The shaft passed through the shoot and it was not explored farther at that time.

At the Utica mines, in Angels, the entire plant is in operation by electricity, the installation having been completed on the 15th inst.

El Dorado.

The 10-stamp mill recently bought by the Kimble M. Co. at the Franklin mine at Texas Hill is now in place on the Kimble mine south of Placerville. This property is the Ames ground. The company has also bought ground adjoining the Ames. They have discovered gravel hitherto unknown, from 2 to 5 feet deep. Water power will be used at the mill. Forty men will be employed.

Fresno.

(Special Correspondence).—The more productive portion of the county is at Oil City, in the hills nine miles northwest of Coalinga, forty miles west of Hanford. There are now about fifteen producing wells at Oil City, most of these being the property of the Coalinga Oil Co. and the Home Oil Co, both paying dividends. The Home Oil Co. paid their stockholders a dividend of $175 per share for October. The Coalinga Oil Co. is composed of Chanslor and Canfield, among the earliest successful producers of oil in this district. Previous to the advent of C. A. Canfield, four years ago, desultory work had been done in the Oil City district. Within the past two years Messrs. Chanslor and Canfield have liquidated an indebtedness of $122,000, accumulated mainly by purchase of a former partner's interest in the business, besides expending many thousands of dollars in development, accumulating an immense plant, buildings, etc. The net profits of the company are said to be $1000 per day.

Such results stimulate purchase and development by other companies. About a dozen outfits are sinking wells in various parts of the Oil City district and a dozen more are on the ground ready to begin. The present output of the district is 2000 barrels of crude oil per day. This is conveyed to tanks on the line of the railroad by a pipe line owned by the Union Oil Co., which company is also prosecuting development work on acquired oil lands in the district. The Coalinga Oil Co. have completed a large tank, with pipe line leading thereto, a mile or more below their wells, and it is probable they will extend their pipe line to the railroad. Altogether there is a tankage in the district to the extent of nearly 70,000 barrels, 39,000 of which are the property of the Coalinga Oil Co.

The principal part of the output from the district comes from eight wells, three or four of which are flowing wells. Coalinga No. 7 is probably the largest producer; then comes the Blue Goose, owned by the Home Oil Co. A 25 H. P. gas engine furnishes power to run the pumps at eleven wells, while two or three pumps are run by individual engines. Gas is the only fuel used in the main camp. It is liberated from the oil as the latter is run into old steam boilers, and is drawn under natural pressure by pipes from the upper portion of these boilers.

A serious drawback in the development work at Oil City has been the scarcity of water. As a general thing the wells do not make enough water to assist in drilling. The water must be taken into the drill hole from the surface. A barrel or more of water is required for each 3 feet drilled. The Coalinga Oil Co. have done much to relieve the water demand at Oil City by pumping it from wells which gave a supply of water while boring for oil, and also by forcing water four miles across the hills from a well in an adjoining canyon. The Coalinga Oil Co. sells $1500 worth of water per month to other companies now prosecuting development work. One company is now sinking wells on the plains, and will from there force water through pipes to a point in the hills where work is being prosecuted.

There are a few promising oil wells in the Kreyenhagen district, twenty miles southwest of Coalinga. Considerable attention is being attracted to this district and several outfits are sinking wells there. In the Parkfield district, north of the Kreyenhagen, the Cholame Valley Oil Co. is sinking a well, which is now down 1300 feet and shows some oil and gas. Other outfits are on the ground in this district.

Coalinga is the focal point for oil districts stretching north and south along the Coast Range of mountains. Although some distance from the oil fields, Hanford is the seat of much of the business activity which marks this industry. The newspapers at Hanford devote considerable space to oil literature and gossip, while the investors or magnates make this town their headquarters, congregating mainly at the Hotel Artesia.

Coalinga, Cal., Nov. 20th, '99.

Kern.

The Shamrock oil well at McKittrick is producing fifty barrels daily.

By the decision of the Supreme Court the litigation involving the Rand group of mines at Randsburg has been settled, and the title rests in John Singleton and associates. They were sued by O. B. Stanton to compel them to sell the group to him, he having a contract signed by a part of the owners. The court holds that such a contract can not be enforced.

Mariposa.

Pocket miners are again finding gold on the ridge northeast of Hornitos. The hill is honey-combed with shallow workings and thousands of dollars have been taken from these deposits, but they never seem to become exhausted.

Nevada.

Grass Valley *Telegraph*: Miles Finlan of Butte, Mont, who was here a few weeks ago, has a bond on the Irish-American and other claims adjoining the Massachusetts Hill mine.

Placer.

A strike is reported from the Oro drift mine near Iowa Hill.

Plumas.

J. S. McDonald has charge of the Cooper and the Genesee copper mines, for Messrs. Hill & Bernard, of Carlin, Nevada, and Mr. Warren, of Utah.

The Plumas-Eureka mine, at one time one of the largest producers of California, after a long idleness is again being operated by Passetta & Tresidder, tributers. They employ twenty men, and twenty stamps are crushing ore.

San Bernardino.

Plans for the 40-stamp mill at Gold mountain, east of Holcomb valley, have been approved by the management for the De Lamar properties.

San Diego.

The Roberts mine, near Escondido, has been sold to J. Reid for $9000. A new shaft is being sunk.

The new Grapevine district, near Warner's ranch, on the confines of the Colorado desert, is said to be developing several promising prospects.

A 300-ton cyanide plant will be built at Hedges at a cost of $20,000 to treat the large pile of tailings from the several mines of the Golden Cross group.

The Free Gold M. Co. is now the owner of the mines at Hedges, subject to the indebtedness due the Golden Cross M. Co., and the amount due Jas. Spiers and those who assigned their claims to him. The aggregate of the claims is about $1,000,000. The lawyers have a claim for $275,000 in the U. S. court at Los Angeles.

Santa Barbara.

The Loma Oil Co., of Los Angeles, have secured options on oil lands near Los Olivos, and will begin sinking wells. F. A. Garbutt is the president of the company.

The Alcatraz Co. is reported to have abandoned its operations near Carpenteria. The piping near the Los Conchas asphaltum and oil mines are being taken out. Work at the La Patera mines has been discontinued and all the material and products have been shipped. The men have been moved to the Sisquoc mines, where the company will concentrate its energies.

Shasta.

The purchase of the Mammoth copper mine, on Little Backbone, will include properties that lie along Little Backbone and Squaw creeks. The proposition includes with the Mammoth, the Balaklala, the Friday & Lowdon, and copper claims owned by the Uncle Sam Co., lying between the lower end of the Mammoth group and the Friday & Lowdon. It is also said to include the Uncle Sam gold mine and the smelter site near the mouth of Squaw creek.

In Happy Camp district copper prospects are being taken up by prospectors, and in the Gazelle district new discoveries have been made.

Siskiyou.

At the Morrison-Carlock mines, in Quartz Valley, forty men are employed. The tunnel being run at the old Turk mine of this group will tap the ledge 150 feet below the old works.

The race track property at Yreka has been bought by H. B. Gillis, representing a company. Machinery will be put in and a shaft sunk to bedrock.

W. T. Shurtliff has reopened the Franklin mine on Rattlesnake creek and has rediscovered the vein lost several years ago by former operators.

Trinity.

R. Woodburn, who recently sold the Globe mine, five miles northeast of Detrick, for $25,000, has brought suit to set the sale aside, claiming that undue influence was used. He had previously refused $225,000 for the property.

The French company operating the large hydraulic mines near Junction City are employing a full force and using 3,000 inches of water.

Redding *Free Press*: H. Oliphant of Anderson has discovered a mine twelve miles southwest of Harrison gulch, in a district which has been little prospected. A ledge 40 feet wide has been uncovered, in which high-grade gold sulphurets are scattered.

Tuolumne.

The Little Wonder mine near Jamestown has again been demonstrated the advisability of crosscutting. In a crosscut made last week in that mine a strike of free gold was made in vein previously unknown.

Fraser, Pratt & Dorsey cleaned up $5000 from a pocket in a Jackass hill mine last week.

James Gillis derives an annual income of $4000 to $8000 from lessees operating the Karrington mine on Jackass hill near Tuttletown.

COLORADO.

BOULDER COUNTY.

The Nelson mine at Ward has been sold to the New York M & D. Co., who are also working the Baltimore. A contract has been let to sink the shaft, now down 300 feet, 200 feet deep deeper. There are 1000 feet of drifts in the Nelson.

CLEAR CREEK COUNTY.

In sinking in the Stanley mine, near Idaho Springs, the ore is found to change from lead ore to copper-bearing ore, carrying gold.

The Oro Verde, on Yankee Hill, has been developed the past year to the extent of 375 feet in tunnel and shaft work, and reported to be in ore of good value.

LAKE COUNTY.

A proposition is being agitated to sink another deep shaft in the Leadville "downtown" region, in East Fifth street. The property is covered by a large number of town lots, the owners of which will exchange their title to them for stock in the new co-operative company.

The Greenback mine is now producing a large tonnage of iron sulphides daily from a large body of ore presumed to be a continuation of the Mahala ore shoot, which was extensively exploited two years ago. This development is stimulating the Rialto lessees, who have workings in the vicinity, to resume active operations.

The A. M. W. Company has enlarged and retimbered the Wolftone shaft to water level, and has cut a station at the 700, where the new pumps will be installed to unwater the Maid of Erin and Wolftone. The combination is already making a large production of lead and copper sulphides through the Mab and Adams discovery shafts.

The Leadville City M. Co., is the name of the new corporation organized to operate mines under the city of Leadville, making the second home company in that district. Operations will be commenced east of Harrison avenue, near Fifth street. Each owner of 2500 square feet of land (city lots) will receive 200 shares of stock for the mining right. This company will sink a deep shaft to determine the value of the underlying territory and has no royalties to pay, which with most leasing companies is a serious handicap to their success.

PITKIN COUNTY.

The suit involving the ownership of the Emma mine and the Aspen Mining & Smelting Co. of Aspen, which has been in the courts for ten years, has been settled, whereby W. Wood, an insane inmate of the Topeka, Kan., asylum receives an interest in the Emma mine and the Aspen M. & S. Co., a judgment againt J. B. Wheeler for $56,000, and a large deficiency judgment against the Aspen M. & S. Co, secured by lien on property in Aspen. The value of the judgments is placed at $504,000.

SUMMIT COUNTY.

The Cashier mine has completed a 20-stamp, rapid-drop mill. The process will be free-gold amalgamation and concentration.

The Jessie mill of forty stamps is running, and twenty tons of concentrates are shipped weekly, in addition to bullion obtained from amalgam.

TELLER COUNTY.

The Whip & Glenn lessees of the Lansing are outputting thirty tons a day, and this is to be increased. It has lately been necessary to haul ore from the mine on the night shift. One hundred and forty-three tons were sent out recently in the three shifts.

In the Granite Hill claim of the Granite Hill Co., on Poverty gulch, a shoot 38 feet in length and 3 feet wide has been opened. In the ore body an 8-inch streak assays twelve to sixteen ounces to the ton. Two feet of ore runs three to five ounces to the ton. Another vein carries 4 inches of talc going four ounces to the ton. The main shoot has been opened in two levels. It has been cut in the shaft and 130 feet of stoping ground blocked out. The claim has shipped several thousand dollars' worth of ore. The property is leased to Wiley and associates, who secured the property with the intention of working the dump. Several tons of dump rock returned $40 to the ton. They then decided to prospect the workings, with the above result.

It is reported that Cone & Robinson, owners of the Doctor mine at Cripple Creek, have refused $600,000 for that property.

The Constantine Co. has closed a deal for the Julia A. and Constantine claims on Raven hill, adjoining the Raven and Joe Dandy, for $110,000 cash. The new company is capitalized at $1,500,000.

The cyanide mill at Florence is blocked with ore, in consequence of which the Hoosier mine will be compelled to store its product in the ore bins on the property for three weeks.

H. J. Anstie, lessee, states that drifting is in progress from the 350-foot level. From thirty to fifty tons is the daily output on the property. The average value of 765 tons shipped is $31.60 per ton.

The Isabella mine at Cripple Creek shipped two cars of ore last week which sold at the Globe smelter in Denver for $160,675. The average value was $3414.57 per ton.

It is reported at Victor that $15,000,000 has been offered for the Gold Coin mines, which offer was refused. It was the intention of the people making the offer, it is said, to organize a corporation in Europe on lines similar to the Venture corporation.

The Elkton mine is reported sold for $156,000. The mine is producing about $20,000 per month, which is reduced at the works of the Colorado-Philadelphia Co. at Colorado City.

From the Blickenstaff lease on the Lucky Gus 125 tons of ore was shipped during the month of October, which averaged five ounces gold to the ton.

The several electrical companies of Cripple Creek district have been consolidated and will be operated under one management. The interests consolidated are the Victor Light, Water & Motor Co., the Gold Belt Electric Co., and the Fremont Electric & Power Co. The name of the consolidation is the Gold Belt Con. Electric Co.

The Isabella, after a long period during which no shipments were made, has recommenced shipping ore. It is reported that fifty tons sold for $160,000.

A rich strike is reported on the Beacon mine of the Prince Albert Co., in the O'Hara lease. They have 18 inches of ore rich in gold and sylvanite.

IDAHO.

IDAHO COUNTY.

(Special Correspondence).—Interest in the new discoveries at Marshall lake, south of Salmon river, is unabated. A number of men are working, under direction of J. N. Rice, on the original discovery and showing up good ore.

The Iola mine, at Warren, is being developed under Supt. J. A. Wood. A shaft is being sunk below the adit level and levels run east and west. The mill, run by water power, has been closed for the winter.

The Little Giant mine is still showing up the rich ore that has characterized that property for fifteen years.

Nothing is being done in Thunder mountain country this winter; but several deals are being put through, and development work will be undertaken in the spring.

The dredger at Florence is under construction and will be ready for operation in the spring.

The Hi You is working a small force of men drifting on the 200 level and reported to be in good ore.

J. Coulter, representing the firm of Campbell & Finch, Spokane, Wash., is in Dixie, making arrangements to work on the Ajax claim, recently bought by his firm.

A shaft is being sunk on the Big Bison claim, at head of Crooked river, in Elk City district, and reported in good milling ore.

Young & Turner of Grangeville have bought a large tract of placer ground on Newsome creek. It will be worked next season on a large scale.

The Dewey Group, near Mt. Idaho, shows 20 feet of copper ore, reported to be worth $20 per ton.

Grangeville, Nov. 17th, '99.

KOOTENAY COUNTY.

A strike has been made in the Keep Cool mine in Lakeview camp on Lake Pend d'Oreille. The mine carries a rich pay streak of silver ore, from which many carloads were shipped from surface workings. A break in the vein caused the early owners to believe that the ore had pinched. Spokane men acquired the property and recently the rich pay streak was opened in a raise from No. 2 tunnel. The values are lead $39.52, gold $4.13 and silver $83.16; total, $126.81 per ton.

SHOSHONE COUNTY.

E. J. Clark is preparing to work the Midnight, on which the Morning M. Co. recently cut a rich ore shoot. He has secured a right of way for a tunnel through the Fanny Gremm.

The mill of the Helena-Frisco mine is to be enlarged to meet the additional requirement of the Galena-Gem and Black Bear mines, recently bought by the Helena-Frisco Co. The workings of the Frisco are 400 feet lower than the lowest of the Gem-Galena mine.

The Black Bear is on a parallel lead 1000 feet north of the Frisco. It will be opened by a crosscut from the 1600 level, 1300 feet below the old workings. The Black Bear vein has been drifted 900 feet, showing ore the full width of the tunnel for that distance.

MICHIGAN.

HOUGHTON COUNTY.

The No. 1 shaft of the Isle Royal mine was flooded by reason of unexpectedly breaking into old workings presumed to be 100 feet distant.

MONTANA.

BEAVERHEAD COUNTY.

The new concentrating plant of the Greenwood M. & M. Co., says the Dillon *Tribune*, is completed, but owing to a scarcity of water the plant will not be put in operation until next spring. The Greenwood M. & M. Co. has a lease upon the tailings dump belonging to the Hecla Con. M. Co. D. T. Haskett, of Butte, is president.

SILVER BOW COUNTY.

It is reported that the Colorado Smelter Co., of Butte, has bonded the Senate mines at Copper Camp, five miles southwest of Moose lake, for $125,000. The group comprises the Snowslide, Hillside, Gem, Chance and Senate claims, the latter showing the greatest value.

A matting furnace in the Butte & Boston smelter at Butte exploded on the 16th inst. as a carload of wet concentrates was being charged into it. It did considerable damage and killed one workman.

NEVADA.

WHITE PINE COUNTY.

A bore hole is to be sunk twenty-five miles east of Eureka to prospect for coal. It is said indications are favorable.

NEW MEXICO.

BERNALILLO COUNTY.

The Puzzle group of mines at Bland have been sold to Eastern capitalists. Considerable development has been done.

OREGON.

BAKER COUNTY.

Spokane *Chronicle*: In September, 1898, the Bonanza mine had 20 stamps, Badger 8, California 10, Red Boy 10, North Pole 10, Columbia 10, E. & E. 20, Pyx 5, Belleview 10, Phœnix 5, H. & H. 10; total, 108. Since then the Bonanza has added 20, Red Boy 10, Badger 10, Golden Eagle 3, Great Northern 10; total, 53, making at present 161. There are now in process of erection mills on the Magnolia with 10 stamps; Golconda, roller and stamps equal to 40 stamps; May Queen 10, Little Giant 10, Maiden's Dream 10, Van Anda 20; total, 100. Some of these will be in operation before January 1st, 1900, and all of them by that date, when there will be 261 stamps crushing rock from mines tributary to Sumpter. In addition to this the Cougar is installing a 250-ton cyanide plant, and other properties are experimenting and preparing to treat ore. Near Baker City the Virtue Con. Mines Co. has 20 stamps, Gold Hill 10, Gold Ridge 10, Weatherby-Bonanza 5, Connor Creek 20, French-Flagstaff 10, Cornucopia Mines of Oregon 20, Baisley-Elkhorn 10, Robbins-Elkhorn 10; total, 115. There are a number of new mills in prospective. Among them the Chloride M. Co. 15 stamps, Safety Deposit G M. Co. 10, Tom Paine 10, Twin Springs M. Co. 20, Portland M. Co. 10; total, 65.

LANE COUNTY.

There are now sixty-four stamps crushing quartz in Bohemia district. Bohemia is the general trading point of the district. There the Musick mine is being operated, and fifteen stamps are crushing on full time.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The American M. Co. of Newcastle, Wyo., has begun a tunnel at the base of Ragged Top mountain, to be a mile long and to connect with a 1000-foot shaft from the top. Reduction works are planned and a town named American City has been laid out, to which the Chicago, Burlington & Quincy is building a branch line.

The Baltimore & Deadwood Co., having completed an addition of ten stamps to its mill at the mouth of Blacktail gulch, two miles above Deadwood, has resumed crushing. A large body of ore is opened in the mine.

The Homestake Co. are working on the old Spearfish ditch and flume line in the Upper Spearfish canyon. This water right was located in 1877 and $400,000 expended on it by the Father de Smet Co., and abandoned. The property was bought by the Homestake Co. in 1882 and it is now to be improved, a pipe line of clay tiles laid and the water taken to a pumping station in Spearfish canyon, where it will be elevated 400 feet and thence flow by gravity to the Homestake mines and to Deadwood. It is estimated $1,000,000 will be expended in making the improvement.

UTAH.

Capt. DeLamar will put in an electric plant at Mercur of sufficient capacity to supply his mines there with light and power, and also furnish light to the town.

JUAB COUNTY.

The Centennial-Eureka, after a suspension of ore shipments during several months, is again shipping to the works of the American Smelting & Refining Co., on the contract to deliver 100,000 tons of ore within thirty months.

SALT LAKE COUNTY.

The United States M. Co. of Bingham, it is announced, have decided to build a smelter of 500 tons daily capacity, to be completed within a year. There is said to be 1,000,000 tons of ore blocked out in the consolidated mines. The new contract with the American Smelting & Refining Co. went into effect on the 16th. The old one was unsatisfactory and shipments were suspended.

The United States M. Co. at Bingham is vigorously developing its property under Mgr. Neill. In October 1945 feet of ground was opened. They have tapped the ore bodies in what is called the commercial vein, the ores varying from milling value to twelve ounces silver, $15 gold and 6.8% copper. Through tunnel No. 1, in Old Jordan and Galena territory, the management drove into the ore body 150 feet west of former development in that portion of the ground. In both branches off tunnel No. 2 they have run in massive sulphides that show 2.5% copper. The Drain tunnel was run through the main ore body, which is 110 feet thick, and on the 400 level, where the greatest depth in Jordan and galena ground has been attained, ore was found which averaged forty ounces silver, $2.40 gold, 3.4% copper and 16.8% lead.

In Niagara ground, through the Davidson tunnel, an ore body has been developed which, with the old Utah workings, opens up a block of ground 150x200 feet, containing 50,000 tons of ore.

The Old Telegraph mine has opened an ore body 250 long by 120 wide. A crosscut from the Roman Empire level into this ore body has been run, showing an average of 6% copper, $2.80 gold and 3.9 ounces silver per ton. In No. 2 crosscut off Grecian Bend tunnel, now in 75 feet, the ore averages 8% copper, $2 gold and three ounces silver, with some 150,000 tons exposed.

SUMMIT COUNTY.

Several drain tunnels have been run in Park district in past years, notably those by the Ontario M. Co., and now another large tunnel is to be run to drain all that portion of the district between Thayer's canyon on the north and the Anchor and Daly-West on the south. The project is being exploited by James McGregor, one of the largest mine owners of the district. The tunnel will begin in Nigger hollow and will be run to a point on the Crescent ground 2400 feet below the surface. It will be 10,000 feet long.

TOOELE COUNTY.

Mgr. J. G. Jacobs of the Salt Lake & Mercur Railroad is working on a project to sink a shaft to determine whether the auriferous zones of Mercur are underlaid by the carbonate and sulphide zones of Bingham. It is proposed to sink the shaft in the town of Mercur. It is not known to what depth this trial shaft must be sunk to determine the geological problem.

UINTAH COUNTY.

The Boston purchasers of the gilsonite mines have made another payment.

WAYNE COUNTY.

Miners in the old Bromide mine at Hawksville have sold a portion of their prospect on a basis of $200,000 for the whole. The ore is rich copper sulphide. It was bought by a London company, which had expended a large amount of money in the camp without finding anything of value.

WASHINGTON.

FERRY COUNTY.

A strike of 6 feet of galena is reported from the Harvest silver lead mine, on the south half of the Colville reservation, eighteen miles south of Republic.

The Republic M. Co. have taken over the Jim Blaine mine at Republic. It is the south extension of the Republic mine, and on the same vein.

H. Waisman, of Republic, has bonded the Copper Mountain group, three miles from Bolster and two miles south of the international boundary line on Copper mountain. The group consists of the Copper Queen and No. 9 claims. They are 2000 feet above Meyers creek and may be developed by tunnel. The bond runs from one year from Nov. 15th. The consideration is $60,000. On the Copper Queen there is a shaft 25 feet deep, all in ore. An assay taken across the shaft showed $7.50 in gold, eight ounces silver and 17½% copper.

Spokesman-Review: The old process is to be thrown aside in the Republic mill. A furnace has been erected and ore is being roasted and treated by the straight leaching method. This is experimental and it will be continued until the new mill is ready, and information gained by experiment will be of value in the new plant. The first-class ore will be sacked and shipped to a smelter to enable the company to pay regular dividends.

It is reported a strike of copper-silver-lead ore has been made on Deer creek, near the town of Curlew, in the northeast corner of the Colville reservation, on one of the claims of the Drummers' Development Co.'s property, ten miles southwest of Nelson, B. C., in a crosscut at the 75-foot level, where there is 3 feet of copper-silver-lead ore.

KITTITAS COUNTY.

J. W. Boggs, the Gen. Mgr., says the cyanide plant at Blewett will start up Dec. 1. J. G Rosenberg is Supt.

OKANOGAN COUNTY.

H. D. Brown, chemist of the Canadian Copper Co., gives as a result of fifty-one surface samples, from fourteen locations in the Palmer mountain tunnel group, $16.02 in gold, and from fifteen veins crossed in the tunnel between 100 and 1000 feet, $28 in gold. The Golden Zone claims $30 as their average. The Bull Frog has cyanided eleven tons of ore, the assay value of which was $19.50, and it returned $17 50 in gold. The Okanogan Free Gold Mines Ltd. paid ¼c dividend—$4000—from a run of thirty days through a 10-stamp mill, about 600 tons. It cost $2 per ton to mine and mill. The average mill run from Black Bear and War Eagle, the first year they were operated, was $24, and no concentrates saved.

On the southeast slope of Palmer mountain the Marietta Co. has a group of nine locations covering five parallel veins which are traced 3000 feet on the surface.

SNOHOMISH COUNTY.

It is reported at Seattle that the Monte Cristo mine and the Everett smelter have been sold to a German syndicate for $1,200,000.

STEVENS COUNTY.

The United States Marble Co. is opening the deposits of green onyx, fifty miles west of Spokane, and is installing a plant. The stone is found in large quantities.

WYOMING.

CARBON COUNTY.

The Eureka Co. near Grand Encampment are drifting on the vein preparatory to stoping and are raising enough ore to pay a profit above expenses. They have recently bought the Cliff, Black Eagle and Gray Eagle, on the south fork of the river. There is a deal pending between the Eureka Co. and Boston people whereby the latter will secure control of the Eureka mine.

FOREIGN.

AUSTRALIA.

The gold output of New South Wales for the month of October amounted to £80,100, and for the first ten months of the year to £408,600, showing an increase of £156,100.

The Mining Commissioner at Mount Morgan states that the quantity of ore treated at the mine during the last year was 186,166 tons; 5313 tons of tailings and 35 tons 9 cwts. 3 lbs. of concentrates were also treated, making the total 191,514 tons 9 cwts 3 lbs. The yield of gold from the ore was 161,597 ozs 6 dwts., from the tailings 3462 ozs. 10 dwts., and from the concentrates 2249 ozs., making a total yield of 16,308 ozs. 16 dwts., of a value of £684,486 19s 6d. The average yield per ton of ore was 17 dwts. 8¼ grains. In '97 the amount of ore treated was 127,107 tons, and the yield was 168,623 ozs. 13 dwts. The average yield per ton was 1 oz. 6 dwts. 12¾ grains. The increased production in '98 amounted to 59,059 tons; but the yield of gold was 7036 ozs. 7 dwts. less. The average yield of gold per ton was 9 dwts. The quantity of material treated shows an increase of 64,346 tons 4 cwts. 18 lbs, on last year, while the yield of gold is 2888 ozs. 10 dwts. less, and the total value of the gold is £13,164 11s 9½d less. The decreased yield per ton may be accounted for by the fact that large quantities of the poorer ores were operated on.

The Mount Usher mine shows improved prospects. The ore treated was 1502 tons 13 cwts., tailings 289 tons; total, 1791 tons 13 cwts; the yield of gold was 2214 ozs. 15 dwts. 10 grains from ore and 51 ozs. 10 dwts. from tailings; total, 2266 ozs. 5 dwts. 10 grains; an increase on last year of 850 ozs. 7 dwts. 21 grains. The average yield of gold for the year from ore is 1 oz. 9 dwts. 11¼ grains, as against 1 oz. 3 dwts. 12¾ grains for '97—an increase of 5 dwts. 23 grains.

Prospecting has been done in the vicinity of the Mount Morgan mine during the year, to discover the continuation of the Mount Morgan mines deposits. The Light of Day, Hidden Treasure, Sugar Loaf Extended, Rockhampton Prospectors, Mount Morgan North, Mount Morgan North No. 1 and Mount Morgan Extended mines have all been worked, but thus far without finding anything of value. Six hundred men are employed in the district.

Gold production in Australia for the first eight months of this year aggregated 2,743,081 ounces, an increase over 1898 of 542,864 ounces, valued at $10,000,000.

London *Mining Journal*: Orange reports rich gold and copper discoveries in the district recently. Robinson & Dowton from a claim at Byng obtained 6½ pounds of gold from a bucket of ore taken from the lode at a depth of 30 feet. Sydenham & Griffiths have crushed 200 tons of ore from their mine at Palmer's Bulga and obtained gold valued at $4000.——The boom in gold dredging continues; land is being acquired on all the rivers.——The 120-ton water jacket copper smelter at the Blayney Copper M. & S. Co.'s works at Blayney has started on ore from the Annandale mine.——The Central Broken Hill Silver Mines' Kintore shaft has reached a depth of 670 feet. The lode at this depth is composed of clean sulphides averaging 13.6 ounces silver, 18.9% lead and 22% zinc per ton.——The monthly return prepared by the Department of Mines of New South Wales shows that the yield of gold for August was 46,346 ounces, as compared with 15,640 ounces, the yield for the same month of last year. The total yield for the eight months of the year is 295,683 ounces, which is 98,222 ounces in excess of the yield for the same period of '98.

BRITISH COLUMBIA.

(Special Correspondence).—The Winnipeg mine in Wellington Camp, Yale district, is making a fine showing at the 300-foot level, where a body of copper-gold ore assaying $50 to $70 a ton was cut.

The Dominion Copper Company's properties in Phoenix Camp are being developed on a large scale. Some of the claims, the Brooklyn, Stemwinder, Idaho, Montezuma and Rawhide will begin to ship in a few days. The steel is being laid on the spur line from Eholt, and shipping charges on ore are expected not to exceed $1 a ton. The cost of extraction will be between $1 and $2 a ton, and smelting charges about $4. The ore averages 3 to 4 per cent in copper and $5 a ton in gold. A heavy contract is to be given for machinery, and tenders have been asked for. Financially the Dominion Copper Co. is one of the strongest concerns in Canada.

The Yankee Boy and Yankee Girl claims on Hardy mountain have shipped to the Trail smelter the first consignment of thirty tons. Returns have not been made public. The present workers have a $25,000 bond on the claims, which soon expires.

The Pathfinder, on the North Fork of the Kettle, twelve miles from Columbia, is being developed into a mine. The ore carries both copper and gold, which is richer than the average in these camps, running 4 per cent in copper and $28 in gold.

The Volcanic mine in Brown's Camp is being developed by a 600-foot tunnel, and it may be longer. The iron cap showing on the face of a bluff is a landmark.

The Granby Smelter Co.'s smelter is being built as rapidly as possible. Two hundred men are at work on the smelter, and a large force on the dam a mile above it, on the North Fork. The smelter will have the use of 1200 H. P., derived from a 45-foot head. The capacity will be 500 tons a day at first, but two additional furnaces may be installed before another year.

Trail, B. C., Nov. 15th, '99.

(Special Correspondence). — The Pythian mine continues to make regular shipments of ore to the Hall smelter.

The Gordon mine, on the north side of the South Thompson river, is shipping, the ore being sent to the Trail smelter.

The Glen iron mines at Cherry Creek have resumed operations. J. F. Wells is in charge, and the ore is being sent to the Hall smelter.

The tunnel on the Kimberley is in 237 feet, the last 16 being in solid 5% copper-gold ore.

The following mining experts have been in the camp during the past two weeks, looking for properties for capitalists: Mr. Hughes, representing Messrs. McKenzie & Mann; Mr. Scott, representing English capitalists; Messrs. Bollot Bros., representing Paris cap-

ital; W. M. Brewer, representing a Victoria syndicate; Mr. Bellamy, representing a Nelson company, and Mr. Currie, on behalf of the Scottish Mines Syndicate of British Columbia. Boillot Bros. secured two properties, and the other parties have taken options on several prospects.

The Hill Top, one of the properties recently acquired by Boillet Bros., is showing a ledge of ore 50 feet in width. The ore runs $20 to the ton.

Kamloops, B. C., Nov. 17.

The people of Kalso and the Provincial Government are building a wagon road from Kalso to the new Mansfield district, at the head of the north fork of Kalso creek. The veins carry rich gold ores, and a number of the most important claims are being worked. A 700-foot tunnel has been started to develop the Joker lead.

The completion of the railroad into the Boundary district has occasioned a rush of shippers, the Oro Denoro being the first to send out a shipment. In Providence Camp, the Gold Bug shipped by wagon to Grand Forks and thence to Trail by rail.

The Iron Mask, at Rossland, is developing a large body of ore, all of shipping grade. The shoot is 15 feet wide and averages $30 per ton. Sixty men are employed.

The Dominion Copper Co., owners of six mines in Phœnix Camp, are inviting tenders for machinery. The 5-drill compressor and steam hoist on the Brooklyn is to be transferred to the Rawhide. A 20-drill compressor is to be bought for the Brooklyn and Stemwinder, each of which will have a steam hoist. The Stemwinder hoist is to go to the Idaho. The shaft on the Brooklyn is 250 feet deep, all in ore, except a horse at 60 feet from the surface. The Stemwinder incline shaft followed the ore to the 150 level, when the vein dipped back. The shaft is down 162 feet and a crosscut will be run soon to cut the vein.

The spur line from the Columbia & Western, at Eholt, is graded to the dumps. Trial shipments are to be made to the smelting works at Trail.

The average assay of the Dominion Copper Co.'s mines at Phœnix is 3.5% to 4% of copper and $4 to $5 gold. Coal from the Crow's Nest mines will be used at the hoists, costing $8 a ton delivered. Mgr. F. C. Robbins reports the average of all assays of the Brooklyn-Stemwinder ore at $11.21, allowing 13 cents a pound for the copper contents. He says there are five or six lodes running across Phœnix camp, but that the full width of these lodes is not profitable ore. The Brooklyn and Idaho are upon the same lode, the Stemwinder and Montezuma upon another and the Rawhide on a third. The Brooklyn lode has been crosscut at the surface in several places, also at 150 feet in the Brooklyn shaft, and proved to be 100 feet wide. On the Idaho the same vein is 150 feet wide. The Stemwinder has mineralized croppings 250 feet wide, but there are several faults and dislocations. The two lodes are parallel, and the side lines of the group are not over 200 feet apart. The Rawhide is a mile from the others and has a vein 80 feet wide.

A strike has been made in the Winnipeg mine, in Wellington camp, at the 300-foot level, where, it is reported, 35 feet of ore running $50 to $70 a ton has been opened. There is a large amount of shipping ore on the dump. When the railroad is completed, the Winnipeg, Brandon and Golden Crown, in Wellington camp, the B. C., in Summit camp, and the Pathfinder, in the North Fork, will begin shipping.

The Rossland mines' payroll is now about $130,000 monthly. The Le Roi disburses $33,000, the War Eagle $30,000 and the Center Star $16,000 monthly.

Ore shipments from the Rossland mines last week aggregated 5344 tons, an increase of 86 tons over the output of the camp for the previous week. The Le Roi shipments amounted to 2432 tons; the War Eagle, 1906 tons; the Center Star, 864 tons, and the Iron Mask, 100. The total output of the camp since the first of the year is 155,668 tons.

The first shipment of ore by rail from Greenwood was made on the 18th inst., when the Boundary Creek Mining & Milling Co. shipped two cars of high grade ore from the Gold Bug, in Providence Camp, to the Trail smelter. The cars were decorated with flags.

The Abe Lincoln Mining Company at Rossland will put in a 5-drill air compressor.

COLOMBIA, S. A.

The Colombia Con. M. Co. has been organized in Boston under the laws of West Virginia, with a capital of $1,500,000. The properties of the company are on the Porce river, in Antiochia, United States of Colombia. They consist of an area of thirty-six square miles. The machinery is at La Catada mine and operations will be commenced there. Antiochia is in a mountainous part of South America and two-thirds of all the gold produced in South America is mined in this province.

CUBA.

It is reported that the Ponupo manganese mine on the south coast, near Santiago de Cuba, has been sold to the Carnegie Co. The ore is said to contain 65% manganese oxide.

MEXICO.

The annual report of the Grand Central mine, which was submitted to the company at its recent meeting in London, shows that during the year ending August 31, '99, a net profit of £93,033 1s 8d was realized, to which was added £22,943 14s 5d carried over from the previous year, making a total of £115,976 16s 1d, less £9617 17s 10d expended on improvements. During the year £75,000 were disbursed in dividends, leaving a cash balance of £31,358 18s 3d.

Nogales *Oasis*: La Rufa, the silver mine beyond La Barranca, owned by Prietas and La Colorada men, continues to produce. The dividend to stockholders on November 1st was $1500 per share.——The Kansas City & Sonora M. Co., which owns the Ramona mine at Gabilan, in the Ures district, is putting up a 10-stamp mill.

At La Colorada, near Las Amarillas, the construction of the new cyanide plant is under way for the Minas Prietas Reduction Syndicate, Ltd., of London. At this plant the Siemens-Halske process will be employed. This process depends upon the fact that an electric current liberates tde metalloid in an aurocyanide solution at the positive pole and deposits it at the negative pole. In this operation iron is used for the anode or positive element and sheets of lead for the cathode or negative element. When the weak electric current is turned on Prussian blue is generated at the positive pole from the reaction of the oxide of iron and ferrocyanide, and gold is deposited on the lead sheets in a hard, bright, yellow film. The lead is separated from the gold and reused in the process with small mechanical loss. The company has a contract to work the large tailings dumps at Las Amarillas, and also to treat tailings which come from the mill. The capacity of the plant will be about 400 tons daily, about equally divided between the old dumps and the mill. There will be a separation of the tailings into sands and slimes, and these will be treated separately. C. A. Butters is managing director.

NEW ZEALAND.

A reef containing molybdenite has been discovered in the bed of the Ohio creek, Thames Gold Field. The reef is composed of quartz and black-colored iron pyrites, with a little copper pyrites. In places the mineral forms bunches of iron pyrites, containing in their centers flakes of molybdenite. The outcrop is not rich enough to work for molybdenum, though specimens about 1 inch square have been found in it. Mr. Skey states that he has seen molybdenite in auriferous quartz from the reef in the Moonlight mine, in the Paparoa district. The molybdenite there seems to be associated with the gold, because it is found that where rich seams of molybdenite occur in the reef rich shoots of gold are found.

SOUTH AFRICA.

The twelfth annual report of the Jumpers G. M. Co. was submitted at a recent meeting of the company. Since the first dividend of 5% was declared in November, 1887, the Jumpers has returned £311,500 to shareholders. The last two dividends of 50% and 25%, respectively, were paid in December and July of the present fiscal year. During the year 137,700 tons were crushed, resulting in the following revenue:

		—Per ton milled— Dwts.	
By amalgamation	£166,887	5.7792	24s 2.87d
Cyaniding concentrates.	21,235	0.7339	3s 1.01d
Cyaniding sand	57,778	1.9987	8s 4.70d
Totals	£245,900	8.5118	35s 8.58d

The expenditure on working was:

				Per ton	
Mining	£ 66,293	0	0	9s	7.543d
Hauling and pumping	17,211	18	7	2s	5.999d
Transport	6,623	1	6	0s	11 543d
Milling	30,889	8	3	4s	5.837d
Charges	5,233	9	6	0s	9.121d
Totals	£126,250	17	10	18s	4.043d
Redemption	20,655	0	0	3s	0.000d
	£146,905	17	10	21s	4.043d
Cyaniding	16,114	10	8	2s	4.086d
	£163,020	8	6	23s	8.129d

In the year ended July 31st, 1898, the average recovery was 8.306 dwts. per ton crushed, and during the year under review it amounted to 8.44 dwts. During the year the 100-stamp mill ran 322½ days, crushing 137,700 tons of ore of 2000 lbs. each, or a duty of 4.270 tons per stamp for twenty-four hours. The short run for the year was occasioned by repairs in the mill.

SOUTH AMERICA.

The Playa de Oro M. Co., Ecuador, has raised $100,000 by the issue of bonds, paid off all debt and has now $30,000 for working purposes. The company has issued a circular giving the progress of the company to date. Two hundred and thirty men are at work. There were twenty-seven applicants for the position of placer mining engineer. Thomas Clark of Placerville, Cal., was selected. He and his associates left Panama Oct. 24th for the company's mines.

TASMANIA.

The Mount Lyell is now producing 20,000 tons of ore monthly from the open cuts and underground workings.

The gold output of Tasmania for the quarter ending Oct. 1st amounted to 20,000 ounces, an increase of 9000 ounces over the corresponding period of last year.

At Mount Lyell the winze in No. 5 tunnel is down 120 feet and is producing ore. Nine and sometimes ten furnaces at the reduction works have been in operation. Gray schist carrying bornite and copper pyrites in quartzite is being passed through in No. 2 tunnel of the North Lyell. The shaft of the South Lyell mine is down 564 feet, the last 40 feet being in the ore body, averaging 9.25% copper. Assays of the gray copper ore disseminated through the shaft gives 25% copper and rich in silver.

Mineral Specimens.

Some recent additions to the collections of the California State Mining Bureau are:

Gold quartz showing free gold, from the Rica Terra and Mina Rica claims, Picacho district, San Diego Co., Cal., with the wall and country rock (vitrophyre); P. C. Du Bois, M. E.

Gold quartz and talcose slate, rich in free gold; Yellow Rose of Texas mine, Coffee Creek, Trinity Co., Cal.; G. L. Carr.

Auriferous sand from the sluices of the Kia Ora dredger, operating near Oroville, Butte Co., Cal.; R. H. Postlethwaite, E. M.

Gold quartz with telluride of gold, Gold Bug mine, Coffee Creek; gold quartz from the Bonanza King and Loftus mines; gold-bearing porphyry, Coffee Creek; copper ore, Copper Bottom mine, Cedar Creek, Trinity Co., Cal., all from H. Z. Osborne.

Josephinite, Placer, Oregon; W. H. Hampton.

Gold quartz with visible free gold from the Hazel, Lone Star, Hunter and Dwinell mines, Siskiyou Co., Cal.; Dr. G. W. Dwinell.

Copper ores and matte from "The Copper Mines," Campo Seco, Calaveras Co., Cal.; B. G. Randall.

Roofing slate from the quarry of the Pacific Slate Co., and copper ore carrying gold from the U. Roy mine, Indian Gulch, Mariposa Co., Cal.; S. S. Burge, Mgr.

Stream tin and bedrocks, dike rocks, etc.; Klondike district, B. N. W. Ter.; and arquerite, native amalgam of silver and mercury from Omineca district; J. Sloan Johnson.

Stream tin, two samples, and lode tin, two samples, Vegetable Creek, New South Wales; A Chandler.

Gold quartz, said to assay $122 gold per ton; Circle City, Alaska; M. Fisher.

Gold quartz rich in free gold, three specimens from Bolivia and Chile; C. T. Ward, Jr.

Gold quartz, several specimens; Argonaut mine, Jackson, Cal.; from the company.

Vanadinite, very fine specimen from Silver district, Arizona; Chas. W. Livermore.

Gold quartz, high grade; King Solomon mine, Siskiyou Co., Cal.; F. N. Fletcher.

H. S. DURDEN, Curator.

Industrial Notes.

—The Pacific Coast Telephone Co. has 60,329 subscribers.

—Washington's shingle mills have shut down to keep up prices.

—Arizona is arranging for a mineral display at the Paris Exposition.

—Japan and South Africa are importing coal from the United States.

—Daily 1000 tons of steel plate are used in the manufacture of steel cars.

—An electric railway is projected from Dyea, Alaska, to Lake Bennett.

—The business of Colorado railroads is delayed by a scarcity of steam coal.

—The Buffalo, N. Y., *Express* is printed by electric power from Niagara Falls.

—The Colorado Southern railroad is figuring to get control of the Colorado Midland.

—Libby, Montana, is to have an electric light plant and a system of water works.

—Choteau, Montana, fears a coal shortage because of a miners' strike at Lethbridge.

—The Chicago, Burlington & Quincy R. R. will extend its line westward into Wyoming.

—The American Steel & Wire Co. employs 36,000 men and averages an output of 700 tons daily.

—Rossland, B. C., announces "a pine trust" in the Kootenays, with a general advance in the price of lumber.

—Leadville, Colo., is weekly shipping 1200 tons zinc ore and concentrates to Galveston, Texas, and Belgium.

—Los Angeles, Cal., is to have a merchants' and manufacturers' industrial exposition in February and March, 1900.

—The Mexican Central Railway is building a branch line to Zapotlan, and will extend it to Manzanillo, on the Pacific coast.

—There are thirty-five carloads of heavy mining machinery at Thornton station, N. M., to be hauled to Bland by wagon.

—The Philippine Islands report a profitable investment for American capital in the cultivation of rubber—the ficus elastica.

—The Government vessel Nero is surveying a route for the Pacific cable from San Francisco to the Philippines, via Honolulu.

—The through sleeping-car service between Kansas City and the City of Mexico, over the Atchison and Mexican Central lines, makes a run of 2396 miles.

—Melbourne, Australia, imported 727 tons wire fence in August, '99. Of this 409 tons were from the United States, 300 from Germany, 18 from England.

—On the Midland division of the Consolidated railway, New London, Conn., on the 5th inst., seven and one-quarter miles of standard 100-pound rails were laid in five hours.

—San Francisco will vote on the 27th and 29th prox. on a proposition to bond the city for $9,275,000 to extend the park, build schoolhouses and establish a drainage system.

—Troops by the thousand still weekly leave San Francisco for the Philippines. On one of the Government transports—the Hancock—on the 21st, went $4,000,000 in coin for the U. S. army paymaster at Manila.

—The reconstruction of the electric plant of the Standard Electric Co. of California, which was recently burned near Mokelumne Hill, has commenced at a point on the Mokolumne river four miles above the former site.

—Several of the largest mines of the Parral district, State of Chihuahua, Mexico, are to be equipped with electric light and power plants. The machinery for these improvements has been ordered from the United States.

—The gross earnings of the Southern Pacific Co. for July, August and September, '99, aggregate $16,254,534, an increase of $2,626,-169 over the same period of 1898. Operating expenses were $9,798,628, an increase of $1,-427,394.

—The Cascade, Wash., tunnel will be about three miles in length; at the west end a drift has been made 3300 feet; at the east end is a drift 3500 feet. Laborers are paid $2 a day; drillers, $3.75. A number of the men employed live at Wellington. The company has put in at the west mouth of the tunnel an air compresser, electric lighting plant, bunkhouses and hospital. It will be fully a year and a half before the work is completed and and the old switchback done away with.

—For several years past, until recently, the prices of iron and steel were lower in this country than abroad, and the result was a rapid increase in our exports of machinery and implements. Now the situation is reversed, and it is with difficulty that manufacturers can hold their trade and make a profit.

—The receipts from the sales of public lands in Oregon during the past fiscal year amounted to $148,390, which represents the sale of 540,428 acres. The sales in Washington aggregated $130,423, representing 498,948 acres. In Idaho the sale of 516,536 acres brought $113,696. In Alaska the receipts were $1138.

—Vice-President Mariscal of Mexico, in the course of an article entitled "The Mexico of To-day," relates that for 300 years Mexico has produced one-third of all the silver that was mined. The production at present is more than $60,000,000 per annum. Mexico expects to supply the world with $100,000,000 silver per annum.

Personal.

MARCUS DALY of Montana is ill in New York City.

S. J. JOHNS is Supt. Whitlock mine, Mariposa Co., Cal.

DR. E. H. COOK, of New York City, is in Denver, Colo.

CYRUS MCARTHUR has returned to Denver, Colo., from Mexico.

COLIN TIMMONS has returned from Denver, Colo., to Chloride, Arizona.

F. W. PAGE, Mgr. Blue Gravel G. M. Co., Yreka, Cal., is in San Francisco.

WM. VAN SLOOTEN has returned from Grass Valley, Cal., to New York City.

J. ALLEN has gone to Manila, where he proposes building an electric railway system.

DUNBAR B. SCOTT of Ironwood, Mich., has been appointed Supt. Phœnix mine, Houghton, Mich.

ROSS BROWNE has returned to San Francisco, Cal., from a professional visit to Utah mines.

JAY A. CZIZEK, Idaho's State Mine Inspector, says his State needs better smelting facilities.

C. A. HABERLEIN has been appointed assistant to Gen. Mgr. Hill of the Ray Copper Co. of Arizona.

J. H. HAMMOND is in New York City, en route to Mexico, and expects to visit San Francisco next year.

F. CHAPPELLET, SR., Pres. Eureka Con. Drift M. Co., has returned from Placer Co., Cal., to San Francisco.

J. H. THOMAS now has charge of the Claybank mine, La Porte, Cal., and expects to employ 100 men thereon.

BERT SEABOLDT of Salt Lake City, Utah, has been appointed Mgr. of the gilsonite mines in northeastern Utah.

RICHARD VINCENT has been appointed foreman of the Maryland mine, near Grass Valley, vice Chas. Thomas, resigned.

PROF. DE KALB of the Kingston, Ontario, School of Mines, thinks that that province is greatly in need of trained miners.

A. F. HOLDEN, managing director United States Mining Co., of Bingham, Utah, is in Cleveland, Ohio, to remain some time.

C. H. LINDLEY has returned to San Francisco from Wardner, Idaho, having concluded his work in the Sullivan-Bunker Hill case.

R. DEWITT, who formerly superintended the Van Avery mine at Blue Canyon, Placer Co., Cal., has gone to Stent, in Tuolumne Co.

J. M. DAVIDSON, a U. S. Deputy Mineral Surveyor, has returned from Nome, Alaska, where he has been engaged in civil engineering the past season.

W. C. RALSTON, Pres. California State Miners' Association, has returned to San Francisco from Robinson's Ferry, Cal., and on the 1st prox. goes to Boston, Mass.

JAS. N. MCBRIDE, Pres. La Sal Copper M. Co., Cushin, Colo., says his company made a mistake in building a smelter; that it was a leaching plant that was wanted, which he is now putting in.

J. W. RICHARDS, assayer and chemist for the Aspen Sampler and Smuggler Mining Co., of Aspen, Colo, continues in that capacity, but with laboratory and office at 1754 Champa St., Denver, Colo.

DIMITRI EVANOV, a Russian mining engineer, is in San Francisco, and says that his government expects the throwing open of the Siberian gold placer fields to purchase next February, will advance their exploration and development.

W. E. C. EUSTIS, president, and C. M. Weld, director of the Melones Con. Mining Co. of Boston, accompanied by G. W. Grayson and W. C. Ralston of San Francisco, Cal., have been inspecting the property of the company at Carson Hill, Calaveras county, Cal.

M. BENARD, who was recently paid $10,000 for plans and designs for buildings at Berkeley, Cal., for the California State University, arrives in San Francisco from Paris this week to confer with the regents of that institution. The proposed buildings are estimated to cost $20,000,000.

A. N. KITTLESON of Stoughton, Wis., recorder of Cape Nome district, is down from that summer resort, and considers the region very rich. He believes that its output will already reach $3,000,000, one-half of which is from the beaches and the other half from the inflowing creeks. The beaches have been prospected and found to pay for forty miles

above and below Nome City, and he thinks that the whole section, from Norton bay to Cape Prince of Wales, a distance of 250 miles, contains gold.

NIKOLA TESLA, who has been experimenting with wireless telegraphy at Colorado Springs, Colo., has returned to New York City. He claims to have perfected a machine by which he can send wireless messages to Paris. His claims are a perpetual delight to the Sunday newspapers.

THEO. RIXON, one of the Government party engaged in a geological survey of the Olympia, Wash, forest reserve, says that no mineral deposits of consequence were found in the reserve and that there is comparatively little timber of any value included within its limits. Three-fourths of the reserve has been surveyed.

GOV. GAGE of California has appointed Prof. W. L. Watts to continue the investigation of the oil-yielding formations of California and Dr. Stephen Bowers of Los Angeles to examine the mineral resources of the State. These appointments have been made in accordance with a law passed by the last California Legislature, placing the appointing power of the field assistant of the State Mining Bureau in the hands of the Governor and appropriating $20,000 for the purpose of carrying on the work.

Commercial Paragraphs.

THE Great Western Pneumatic Tool Co. are opening machine and tool works at 1759-63 Blake St., Denver, Colo.

THE New York Air Compressor Co. has organized under the laws of New Jersey; capital stock, $100,000. It is intended to manufacture air compressing machinery at Arlington, N. J. The New York offices of the company are at 120 Liberty St.

THE Mine & Smelter Supply Co. has fitted up shops in Denver, where the Wilfley concentrators are being manufactured under the personal supervision of Mr. Wilfley, the inventor. White, Rogers & Co., 306 Pine St., San Francisco, are the Pacific coast representatives.

THE Weber Gasoline Engine Co., Kansas City, Mo., has an order for engines aggregating 450 H. P., subdivided in units of 50, 40 and 30 H. P. engines, to operate on No. 2 F. H. distillate, for the Ray Mines, Ltd., Arizona. Another order for a 30 H. P. engine was completed and shipped to the Norwegian Copper Works, Birtavarre, Kaafjord, Lygenfjord, Island of Tromso.

THE San Francisco Novelty & Plating Works, established in 1865, is in the thirty-fifth year of a successful business, which has increased from a moderate beginning until now it has a large and complete plant for the manufacture and replating of silver-plated copper plates for saving gold in quartz and placer mining. Great importance is justly attached to the advantage of silver-plated copper plates, ready for immediate use and always presenting a clean, smooth surface to instantly catch and retain the gold. Verdigris will not form on well-plated silver-plated plates, but will on plain copper ones, thereby losing considerable gold. These plates will save more than sufficient gold to pay for the cost of plating. Owing to the great demand for silver-plated copper plates for the Cape Nome district the San Francisco Novelty & Plating Works has been obliged to increase its force, and is now prepared to fill all mining orders at shortest notice. Wherever their plates are used they are well liked, and the demand is increasing. This company have sent their mining plates nearly all over the world, many plates having been shipped to China, New Zealand, Central and South America, Honolulu, Mexico, Alaska and all over the Pacific coast. This corporation also manufactures gas and electric light fixtures, grill work, elevator enclosures, vault gates, artistic iron and brass work of all description, and carries on gold, silver, copper, nickel and brass plating in all its branches. By strict attention to business and courteous treatment it has gained universal respect and patronage. A visit to their works, northwest corner First and Mission streets, San Francisco, Cal., will convince anyone of the great amount of work they turn out each month. Any information desired regarding contracts for the furnishing of silver-plated mining plates, or any other work in their line, will be readily furnished.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 14, 1899.

636,742.—BANDAGE—J. N. Armstrong, Soldiers' Home, Cal.
636,944.—WAGON COUPLING—O. L. Beckett, Orting, Wash.
636,747.—FLUME—J. A. Blake, Redlands, Cal.
637,077.—HYDRANT—C. L. Burkhart, Dayton, Wash.
636,753.—CULTIVATOR—D. G. Burkhart, Dayton, Wash.
637,081.—CUPEL—A. C. Calkins, Los Angeles, Cal.
636,754.—THRASHER—E. Campbell, Dayton, Wash.

Diplomas Awarded to Van Der Naillen's Engineering School Students.

SAN FRANCISCO, CAL., Nov. 11, 1899.

The A. Van der Naillen School of Engineering, 933 Market street—GENTLEMEN: I take pleasure in informing you that diplomas have been awarded to the following students at your school for their drawings exhibited in your exhibit at the recent Mechanics' Fair:

To the A. Van der Nailen School of Engineering students for working models of engine and boiler: Guy A. Dunne, for Keith motor; H. C. Adair, for Corliss engine; F. A. Gawthorne, topographical map; Fred G. Kellett, 40-stamp mill; Joseph Levensaler, dynamo commutator. To the students for working model of electrical trolley car: George von Boden, American locomotive; A. Gawthorne, underground mining. Yours respectfully,

JOSEPH M. CUMMING,
Secretary Mechanics' Institute.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MAIL BOX TIME INDICATOR.—E. M. Hoagland and D. S. Richardson of Oakland, Cal., Nos. 636,992. 636,993. Dated Nov. 14, 1899 Assignors to the Montague Indicator and Letter Box Co., San Francisco, Cal. The object of this invention is to provide a means for giving important information to the public in a clear and concise manner, also to act as a detector and check and furnish a box-testing system by which the movements and faithfulness of postal employees can be ascertained. It consists of a main chamber for mail matter, an independent chamber or chambers in front of said main chamber, a front chamber having a transverse open slot through its front. Rollers are journaled in the upper and lower portions of this chamber, and an endless belt, consisting of chains and slots or sections bearing dates of collection thereon, are caused to travel across this slot. The door, which is opened for the purpose of collecting the mail from the box, is connected with mechanism which advances this chain belt in such a manner that a new section of the belt will be exposed before the slot by each opening and closing of the door, and this section indicates the time of the next collection, also the outgoing mail by which the letters will be carried away. Devices are arranged for showing the collections for holidays and Sundays, which differ in number from ordinary week days, and means for preventing the movement of the belt during such dates.

QUICK BREAK ELECTRIC SWITCHES.—Robert B. Hewson, San Francisco, Cal. No. 636,989. Dated Nov. 14, 1899. Assignor of one-half interest to Austin Kanzee, of same place. The object of this invention is to make and break the electric circuit in which it is placed by a sudden or snap movement for the purpose of reducing sparking and consequent injury to the contacts. The invention consists of a lever mounted upon an insulated base having one end connected with one of the terminals and the other movable between compressing plates which are connected with the other terminal, the connection consisting of a sliding cylinder movable in a tube, with which the second terminal is connected, and having a spring connection by which, when the contact is broken by the withdrawal of the lever from between the plates, the parts are moved in opposite directions with a sudden movement.

SWIVEL PLANE SUPPORT AND HANDLE.—Carl E. Hanson, San Francisco, Cal. No. 636,983. Dated Nov. 14, 1899. This invention relates to a device for suspending a plane within an operating handle, so as to give it a universal movement with relation to its support. It is particularly adapted for planing floors and the like. The plane has socket pieces fixed at each end in a longitudinal axis, and an enclosing frame has fixed pins adapted to enter the sockets, so that the plane may pivot transversely thereon. To the sides of this frame the forked end of a handle is fulcrumed so that the handle may be moved up and down with relation to the frame and the plane, the two movements thus provided forming a universal movement, which will allow the plane to be pushed over the surface and maintain its own parallelism regardless of the irregularity of movement of the handle.

RULE.—J. H. Franklin, San Francisco, Cal. No. 636,972. Dated Nov. 14, 1899. In this invention a marking device is attached to the end of the rule, so that when the rule is repeatedly moved as in measuring considerable lengths, the end of each measurement is marked without the use of a pencil or other marking device. This marker consists of an elastic plate fixed to one end of the rule, having its end bent to lie in the plane of the end of the rule and projecting slightly beyond. The edge being made sufficiently sharp to make a mark at the termination of each measurement so that in repeated measurements in a line, the total will be more accurately ascertained than when an exterior marking device is used.

CLAY OR GRAVEL WASHING MACHINES.—W. B. Horr and C. H Gibbons, Jackson, Cal. No. 636,995 Dated Nov. 14, 1899. This apparatus is designed for washing clay or gravel which contains valuable or precious metals, and separating the latter from the clay or gravel. It consists of an inclined cylinder composed of longitudinal interspaced bars and having one end made conical, and of imperforate material. A neck forms a prolongation of this conical end and is formed of parallel interspaced bars which serve as a final screen for any material which passes over the imperforated portion. In conjunction with this cylinder is employed an inclined segmental trough having an end and an extension conforming to the cylinder and its discharge end. The trough has a transversely curved and gated depression near the junction of the imperforate section with the main body.

Recently Declared Mining Dividends.

Gold Coin M. Co., Colorado, $10,000; payable Dec. 25.

Raven G. M. Co., Colorado, $10,000; payable Dec. 20.

North Star M. Co., California, $50,000; Nov. 20.

Deer Trail No. 2 M. Co., Washington, $2500; payable Nov. 25.

National Lead Co., New York, quarterly 1¾%; payable Dec. 15.

Boston-Philadelphia Zinc & Lead Co., Missouri, monthly 1%; Nov. 20.

Osceola M. Co. Co., Michigan, semi-annual dividend, $3 per share, $279,000; payable Dec. 15.

Homestake M. Co., South Dakota, regular 25 cents, extra 25 cents, per share, $105,000; payable Nov. 25.

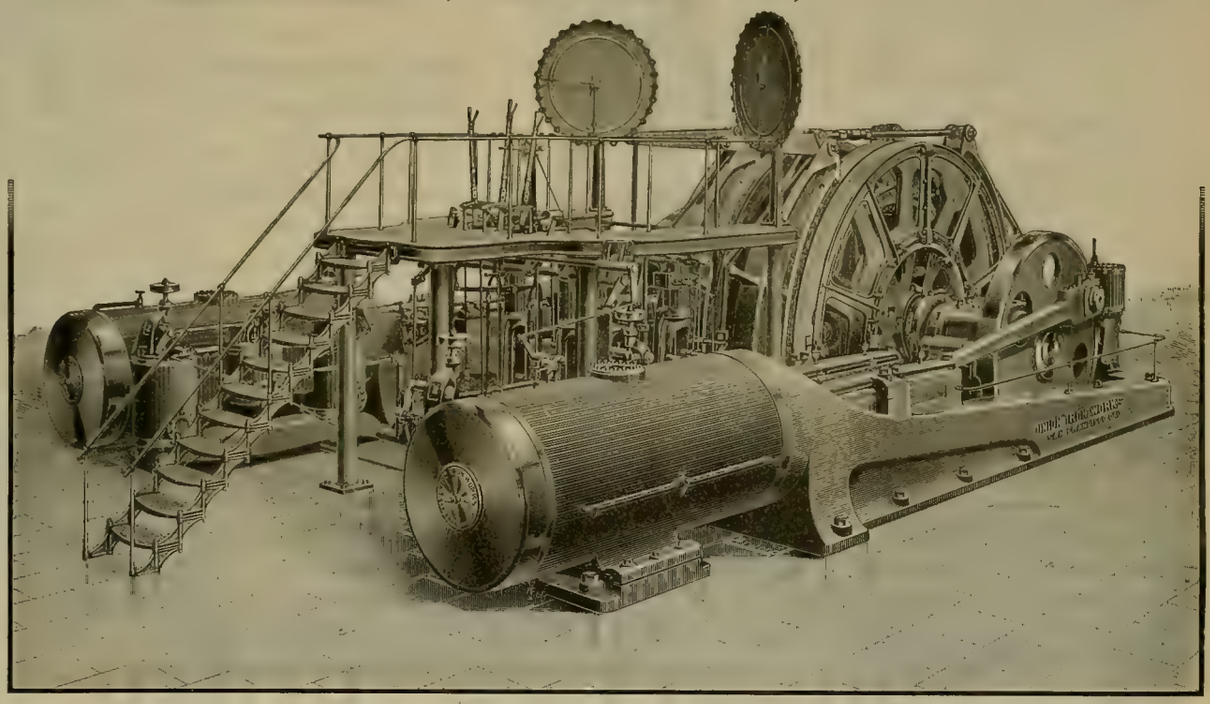
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



30in. x 72in. Direct Acting Hoisting Engine

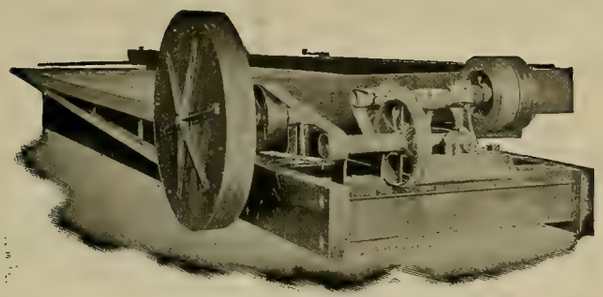
BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.



WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

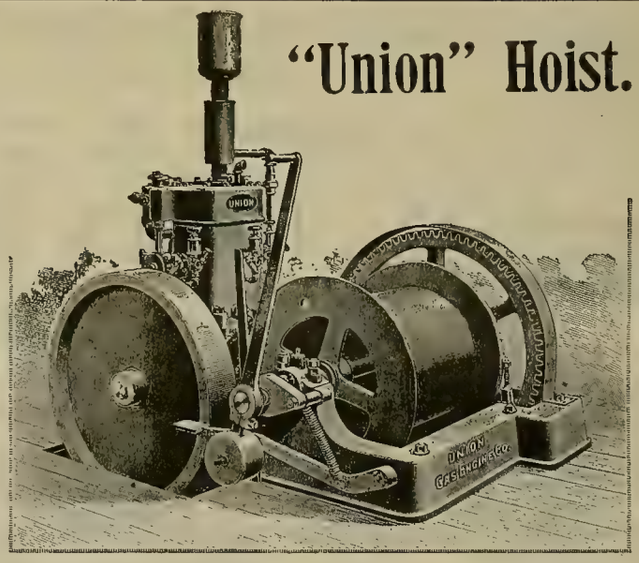
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 530,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.



Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

BUILD THE

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS — 20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

WOOD'S DEEP WELL
PROPELLER PUMP
For Deep or Shallow Lifts.

CAPACITY 100 TO 15,000 GALLONS PER MINUTE.

A simple screw propeller pump without valves or complicated parts. Fits into oil well casing of from 6 to 12 inches diameter and larger, the pump occupying but this space in shafts and in wells without pits dug to water level, and may be operated on an incline or vertically. Specially adapted for sinking purposes, pumping out sumps and river bottoms, and for handling large quantities of water economically and successfully. In writing, state work required.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 120 Pearl St., Boston.

General Arrangement of Pelatan-Clerici Plant.

The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

THE

"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

All of our latest improvements are embodied in this instrument and it is the result of our 13 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.
No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

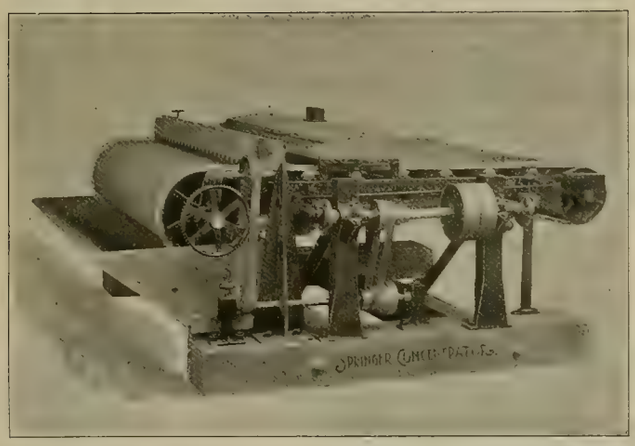
GATES IRON WORKS.

The Original GYRATORY BREAKER.

It is ADJUSTABLE, and INDESTRUCTIBLE.

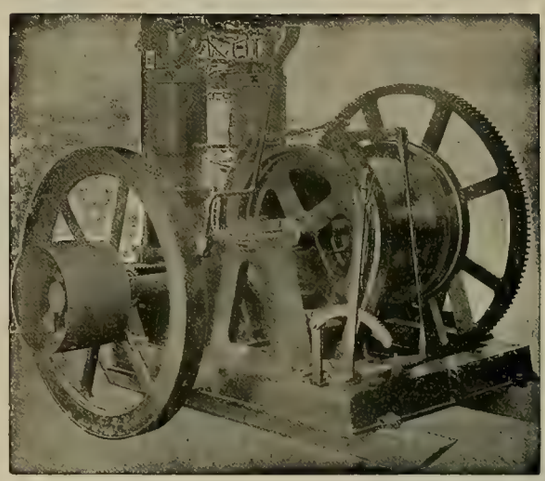
THERE ARE 4,000 OF THEM IN USE.



The South African Mines Have Purchased 200.

. . We build a FINE CRUSHER that is a wonder. . We know how to design this class of machinery. . . . There are others who think they know how to make a Gyratory Crusher; they are simply poor imitators of The Only Great Gates Rock and Ore Breaker. .

Address for Catalogue No. 1, Dept. UU, 650 Elston Ave., CHICAGO.



$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**

BOILERS, ENGINES, STEAM HOISTERS, ELECTRIC HOISTERS, ROLLS, CRUSHERS, WILFLEY TABLES. CARS, CAGES, ORE BUCKETS, RAIL, PIPE, FITTINGS, BELTING, ETC., ETC.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : : :

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Market Reports.

SAN FRANCISCO, Nov. 23, 1899.

SILVER.—London, 27¼d; New York, 59; San Francisco, 58⅝@58⅝; Mexican Dollars, 47⅛@48⅛; New York exchange, sight, 10; telegraphic, 15 cents premium.

LEAD.—New York reports steady, $4.60 bid, $4.65 asked; brokers' price, $4.40.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6½c.

COPPER.—New York reports Lake at $17 @17.25; brokers' price, $17.25. Local—Mill copper plates, 23¾c.

The total production of United States mines since January 1, '99, is 219,413 tons, comparing with 201,643 tons for the corresponding period of '98.

The Marquette *Mining Journal* says the recent drop of 1¾ cents per pound in the selling price of Lake copper means a lessening of the annual profits of the Calumet & Hecla mine to the amount of about $1,350,000. The loss is not a serious one, however, for the Calumet & Hecla, even with its profits thus grievously curtailed, will remain the most profitable mine in the world, earning profits each year seven times as great as the total amount of money required in developing the mine. The best mines of the Lake district are making copper around 7 to 8 cents per pound, which, with copper selling at 17 cents per pound, means a profit of 9 to 10 cents per pound, or more than 100%. Copper at 15 cents or better is high, and there seems every reason to believe that 15 cents or more will be obtained for several years to come.

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—11¾@20c per pound.

TIN.—Dull, $28 bid and $28.25 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $50; export, $45.50 @46; carload lots, special rates.

No change has taken place in the price of quicksilver within the past week, the market remaining quiet. That the price will be lower very soon is not anticipated. The indications are rather that it will go still higher.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

ZINC.—Very weak; $4.40 bid, $4.50 asked. The zinc ore market is demoralized, the efforts of the Missouri-Kansas Zinc Miners' Association to maintain prices having proved futile. The downward tendency of metal prices has had its effect on the ore market, and zinc ore has declined $5 to $8 a ton within the past two weeks. The top price paid for high zinc ore was $35 a ton in the bins, but a great deal of high-grade ore brought $34 a ton or less. The prices paid were below the association's schedule, which puts high-grade ore at $40. Many large mine operators refused to sell at the prices offered, thinking that the present conditions will be soon remedied and ore prices advance again. The scarcity of coal and the low prices paid for zinc ore have caused a few of the leading mines and many of the smaller ones to shut down indefinitely. The miners threaten to build a large co-operative smelter and zinc rolling mill.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13¾c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11¾c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

NAILS.—List per keg: No. 20 to 60d, wire, $4.45; cut, $4.15; 10 to 16d, wire, $4.50; cut, $4.20; 8d, wire, $4.55; cut, $4.25; 6 and 7d, wire, $4.65; cut, $4.35; 4 and 5d, wire, $4.75; cut, $4.45; 3d, wire, $4.90; cut, $4.60; 2d, wire, $5.15; cut, $4.85. In carload lots, special rates in carload lots 10c per keg less.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ℔ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5¾ @6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¾@ 2¾c; California refined, 1¾@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ℔ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

CANDLES.—Electric Light Candles—6s, 16 oz., 8¾c; 6s, 14 oz., 7¾c; 6s, 12 oz., 5¾c; 6s, 10 oz., 5¼c; Granite (Mining) Candles—6s, 16 oz., 9¾c, 6s, 14 oz., 8¾c; 6s, 12 oz., 7¾c; 6s, 10 oz., 6¾c. Paraffine Wax Candles—1s, 2s, 4s, 6s, white, 10c; colored, 11c.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 50

THE WM. POWELL CO., CINCINNATI, O.

Quicksilver

——FOR SALE BY——

The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - 426 CALIFORNIA STREET,
SAN FRANCISCO.

Notice of Application for Dissolution.

In the Superior Court of the City and County of San Francisco, State of California.

In the matter of the application for the dissolution of the corporation named, THE GRASS VALLEY WATER COMPANY. Dept. No. 2. No. 70,052.

Notice is hereby given that said corporation, THE GRASS VALLEY WATER COMPANY, on October 17th, 1899, made a voluntary application for dissolution, in writing, to said Court;

That said Court thereupon on said 17th day of October, 1899, made an order directing that said application be filed with the Clerk of said Court, and that said Clerk give thirty-five (35) days' notice of the application by publication in the newspaper named, "Mining and Scientific Press," the same being a newspaper published in said City and County, and that this notice is now given, and will be published according to said order in said newspaper, "Mining and Scientific Press," during the period of thirty-five (35) days from and after the 20th day of October, 1899, the first publication being made on Saturday, October 21st, 1899.

Given under my hand and the seal of the Superior Court of the City and County of San Francisco, State of California, this 17th day of October, 1899.

W. A. DEANE,
County Clerk.
[SEAL] By E. M. THOMPSON,
Deputy Clerk.

Notice of Application for Dissolution.

In the Superior Court of the City and County of San Francisco, State of California.

In the matter of the application for the dissolution of the corporation named, NORTH STAR MINING COMPANY. Dept. No. 2. No. 70,053.

Notice is hereby given that said corporation, NORTH STAR MINING COMPANY, on October 17th, 1899, made a voluntary application for dissolution, in writing, to said Court;

That said Court thereupon on said 17th day of October, 1899, made an order directing that said application be filed with the Clerk of said Court, and that said Clerk give thirty-five (35) days' notice of the application by publication in the newspaper named, "Mining and Scientific Press," the same being a newspaper published in said City and County, and that this notice is now given, and will be published according to said order in said newspaper, "Mining and Scientific Press," during the period of thirty-five (35) days from and after the 20th day of October, 1899, the first publication being made on Saturday, October 21st, 1899.

Given under my hand and the seal of the Superior Court of the City and County of San Francisco, State of California, this 17th day of October, 1899.

W. A. DEANE,
County Clerk.
[SEAL] By E. M. THOMPSON,
Deputy Clerk.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

MINING AND CIVIL ENGINEERING DEPARTMENT: Mathematics, Draughting, Strength of Material, Chemistry, Assaying, Blow-Pipe Analysis, Geology, Mineralogy, Surveying, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation.

ELECTRICAL DEPARTMENT: Theory and Practice; Construction,

BUSINESS: Bookkeeping, Shorthand, Typing, Modern Languages, etc.

Twenty teachers; individual instruction; can enter at any time; Catalogue and Journal free.

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.

No dust. No ashes. Cheap, effective, economical, portable and automatic.

Assessment Notices.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1899, an assessment (No. 117) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 14, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on THURSDAY, the 7th day of December, 1899, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 26th day of December, 1899, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada Block, No. 309 Montgomery street, San Francisco, California.

ARRASTRAVILLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of November, 1899, an assessment (No. 4) of Ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 213 Jackson St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of December, 1899, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 3d day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. MIDDLETON, Secretary.

Office—213 Jackson St., San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of November, 1899, an assessment (No. 14) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 30th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of November, 1899, an assessment (No. 10) of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 632 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of January, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

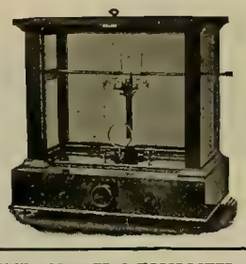
By order of the Board of Directors.

A. F. FREY, Secretary.

Office—632 Sacramento street, San Francisco, California.

DELINQUENT SALE NOTICE.

CALIFORNIA BORAX COMPANY. — Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.



Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 18th day of September, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Jno. L. Bradbury, Trustee	75	100	$200 00
S. L. Harris, Trustee.....	45	50	100 00

And in accordance with law, and an order from the Board of Directors, made on the 13th day of September, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, No. 310 Pine street, room 36, San Francisco, California, on TUESDAY, the 28th day of November, 1899, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine street, room 36, San Francisco, California.

MANUFACTURERS OF

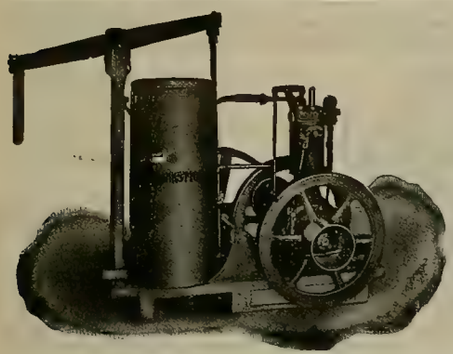
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

"JACK OF ALL TRADES" is provided with Walking Beam (with 5, 8 or 10-inch stroke), Belt Pulley, Torch Igniter, Electric Igniter, Battery and Cooling Tank. Can be lifted by four men.

FAIRBANKS-MORSE

"JACK OF ALL TRADES."

A complete Engine of 1½ Horse Power, which will give excellent results with either gasoline or distillate. Powerful, compact and easily handled. Can be useful on every mine.

SEND FOR SPECIAL CATALOGUE.

FAIRBANKS-MORSE GASOLINE ENGINES.

ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.

FAIRBANKS, MORSE & CO.,

310 Market Street, SAN FRANCISCO, CAL.

201 N. Los Angeles St., LOS ANGELES, CAL.

Newest Ideas in Automobiles.

Since the advent of the automobile this paper has given the latest accurate illustrated accounts of this innovation in transit, as a matter of interest to the mining and scientific world, and herewith shows the newest ideas in the "horseless carriage" line. Additional interest attaches to the automobiles depicted herewith, as, in addition to steam, electricity, gas engine and compressed air, another motive power enters the field, and in the machines illustrated on this page the Auto-Acetylene Co. of New York City claim to have a motor that works successfully.

Of this motor one of the officers of the company says: "It has carried one of our wagons over the road for 6300 miles with but one accident, and the motor to-day is to all appearances as perfect as it was the first month it was in use. All we claim for our automobile is that it works successfully. We do not claim we have the only thing in existence, but we do say that we have one that is provided with a motor, carburetor and steering apparatus that meet all the requirements, and the machine as an automobile is capable of going every day up and down the ordinary grades at a speed suitable for such navigation, without fear of a breakdown at every cross road. The motor runs almost as noiselessly as an electric motor, there is no odor, no danger of explosions, and the operator is not compelled to take out a license as an expert engineer in order to be allowed to manipulate our automobile, nor must he be an expert electrician. A child ten years of age can be taught to operate our wagon in a few hours' time, and it is as easy to start or stop as anything of the kind possibly can be."

FIG. 1.—AN AUTOMOBILE FOR PROSPECTORS.

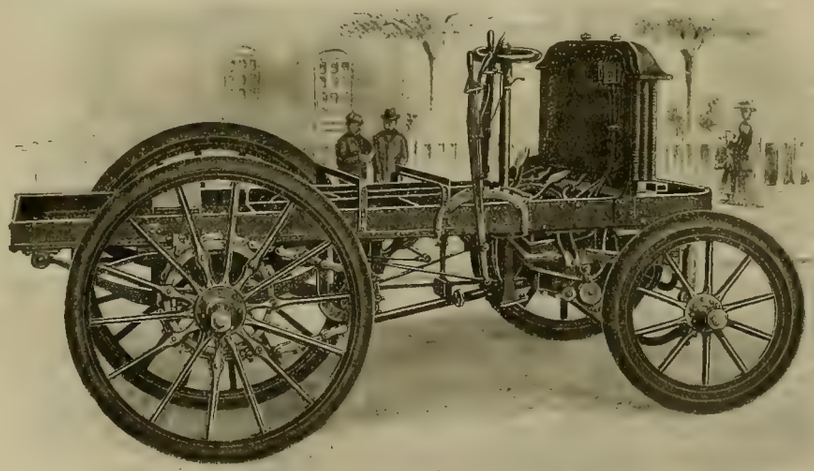

FIG. 2.—RUNNING GEAR FOR AUTOMOBILE TRUCK.

American ingenuity finds full field for exercise in producing new types of automobiles, and practical use will demonstrate which is best deserving of commendation. Fig. 1 depicts what its makers call a "prospectors' automobile," and this will be of most interest to our readers. The one illustrated is intended for use at Mojave, Cal., a wagon weighing 5400 pounds, the motor one of 23 H. P., with a speed when fully loaded of three miles an hour. The idea of the manufacturers is that the "desert express" automobile shall be a little mining camp on wheels, to travel 200 or 300 miles with an ordinary supply of hydrocarbon for the motor, to carry tools, provisions, an ore crusher, an assay furnace, a sleeping bunk, a tent, water, gasoline, etc., and enable the prospector to entirely dispense with the patient and long-suffering burro.

The idea is a progressive one, and, as such idea, deserves commendation, but many objections exist, probably not calculated on by the New York projectors of this aid to the prospector, and which are sufficiently manifest to make detail unnecessary. Were everything in connection with the concern to work all right, the miner or prospector who had the price of such an outfit might find it under certain circumstances a comfortable and profitable investment, but a breakdown on the Mojave desert is a very different proposition from one within a few blocks or miles of a machine shop or supply depot. Like laboratory processes that work all right in a room with every fine appliance at hand, but which are not so satisfactory when commercially applied at the mill or smelter, so a four-wheeler, as designed, that works all right on smooth paved streets may be badly placed for the rough and ready needs of the prospector. Still, the germ of a commendable scheme exists in the device illustrated, and if the New York men can produce such a vehicle that will insure easier and more economical transit to the prospector and miner they will deserve commendation and widespread success. There are no insuperable obstacles to such possible result.

Fig. 2 shows the heavy running gear of one of the Auto-Acetylene Co.'s large, heavy automobiles. Like the "Mojave desert express," it has rubber-tired wheels, which, probably, in rough use would be discarded for an iron wide tire. Fig. 3 shows a carriage for family or touring purposes, a roomy, comfortable conveyance, weighing 700 pounds, burning ordinary gasoline and capable of a speed of twenty-five miles per hour.

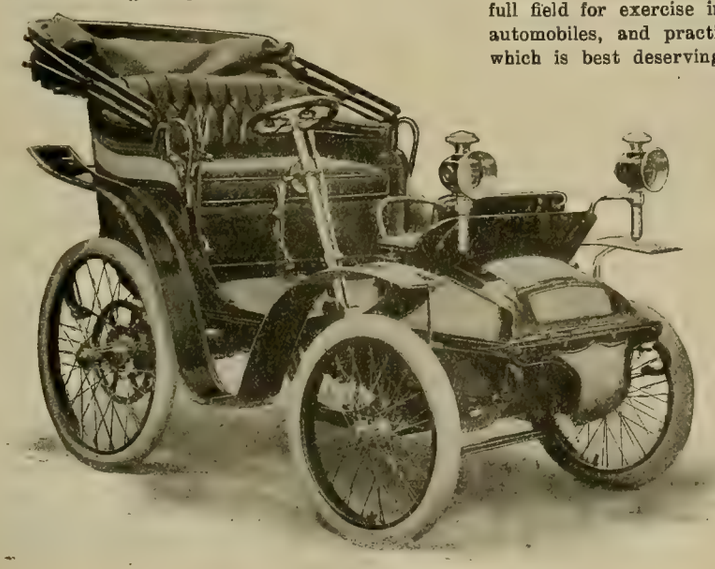

FIG. 3.—THE LATEST HORSELESS CARRIAGE.

An effort is being made by German capitalists to consolidate the nitrate interests of Chile. The mines are valued at $80,000,000. The present output is about 3,000,000 tons annually.

A large deal in Calumet & Hecla copper having been closed whereby that company agrees to deliver 17,000,000 pounds of its product at 17 cents, and the company being out of the market for the time being, it is predicted by metal statisticians that the price of copper will advance.

The miners and mine owners of the Slocan region of British Columbia have at last patched up a truce and the unions have been authorized to supply full crews to several of the mines of that district. For several months past only a few men have been given employment in keeping water out of the workings, looking after timbering, etc., in anticipation of an end of the labor trouble.

The General Commissioner of the United States Land Office at Washington has ruled that affidavits setting forth the mineral character of odd sections in the area of railroad grants will no longer be received for filing by the receivers of land offices, unless such affidavits constitute the initial step in a contest. The Commissioner says: "The very first rule of practice provides that contests may be initiated against any entry, filing or other claim to the public land. There must be something to protest, therefore, before proceedings can be instituted."

That there is great interest being taken in the mineral resources of the Philippines is evident, but those who have in consideration a trip to the South Seas for the purpose of investigating in that direction should remember that knowledge of the resources of the interior of those islands is of the most limited kind. The war has been carried on along and near the coast where there are no mines, and the interior is a terra incognita as yet. The rugged mountainous country in which the mineral deposits would be found, if any of value exist, is the home of savage tribes, and it will be unsafe for small parties to venture into that wilderness for a long time to come. When the war now in progress in the Philippines is at an end investigations will probably be made by Americans now there, many of whom are from the mining regions of the United States. If reports at such time are of a favorable character it will then be time enough to go.

Assessable vs. Non-Assessable Stock.

There appears to be a never-ending discussion as to the relative merits of assessable vs. non-assessable mining shares. Mining companies have been very successfully operated under each, and many have failed under each method of raising money to carry on business. There are advantages in both assessable and non-assessable stocks and disadvantages in either. In California all corporate stock is assessable and any promise on the part of directors to not levy assessments would not be recognized in the courts, if it were later determined to make such levy. There are a few corporations in California organized under the laws of other States the stocks of which are non-assessable. The great fortunes made in Comstock mining stocks, all of which are assessable, has resulted in the people of the Pacific slope being educated to the assessment plan, and there are those who profess to believe that stock issued on the non-assessable basis is prima facie evidence of intent to defraud.

Colorado offers abundant evidence to prove that the non-assessable stock plan, when properly and honestly handled, results as satisfactorily as the assessable stock basis, disproving the statement that a mine can not be successfully opened, equipped and operated on the non-assessable plan. When stock is assessable money needed to equip and explore the mine or for any other purpose, is raised by an assessment of a stated amount per share. This plan can be continued indefinitely, as long in fact as the shareholders will put up, and authenticated instances are on record where several millions of dollars have been paid in by stockholders of a mining company under the assessment plan, and not a single dollar ever disbursed in the form of dividends, but, on the other hand, the stock of some of the largest, best managed and best paying mines in the United States are assessable.

When money is required the board of directors formally levy an assessment, advertise it and otherwise advise stockholders of the fact. In the event of failure to pay the assessment the delinquent stock may be sold to pay said assessment overdue, or such portion thereof as may be necessary to raise the money. By this method means may be secured at any time.

Under the non-assessable scheme the capital stock is usually divided into a large number of shares and a liberal percentage—30 to 60 per cent—placed in the treasury for sale, money being raised by this means to carry on the business of the company. In the event of failure to sell the stock, or if all the treasury stock be sold and the money expended before the mine is self-supporting, then the company's resources for raising funds are at an end, unless a voluntary subscription be made pro rata by stockholders to continue operations, and failure to do this has more than once closed down what later proved to be a valuable property. However, under ordinary circumstances, the amount of money provided for by the sale of treasury stock in non-assessable companies is usually sufficiently large to demonstrate the value of the mine—be it good or bad, and the probability is that where the sum provided for by sale of stock in non-assessable companies fails to place the property on paying basis, if it were operated under the assessment plan the mine would be closed down before an equal amount had been paid in, by reason of failure of stockholders to respond to the call of the directors for more money, which emphasizes the fact that the chief element of success in mining is a good mine.

There are at present in the mining field men who, without qualification by either education or experience, are "reporting on mines," and signing E. M. or M. E. after their names. In most cases a report from such source, upon falling into the hands of a mining engineer, is at once detected by its absurd use of technical and scientific terms, and not infrequently by poor orthography and worse grammar. The chief evil of these reports is usually that they do not recite facts and are calculated to mislead those unfamiliar with the subject of mining. Private letters often accompany these reports of pseudo-experts, endorsing them in the highest terms, thereby making the person writing such letter a party to the fraudulent transaction. Not long since one of these would-be "E. M.'s" addressed a letter to a San Francisco mining engineer, asking endorsement in the form of a letter which would state that he was an experienced and competent mining engineer and metallurgist, explaining that by doing so he (the bogus expert) would be enabled to "earn a good fee." As he was only known to be an expert "tonsorial artist," the letter was not written. Unfortunately, this is not a single instance of this kind.

It has lately been reported that platinum had been discovered in northern Arizona near Cataract canyon. While this may be a fact there is some doubt about it and the statement may be taken with more than the usual allowance. The formation about that portion of Arizona consists chiefly of limestones, shales and sandstones, and thus far platinum has never been found in a similar formation elsewhere. Down in and near the bottom of the canyon of the Colorado river, a few miles from this reported strike, in the Cambrian and Algonkian or crystalline rocks, with their numerous dykes and injected sheets of eruptive rock, the announcement of the discovery of gold, silver, copper, lead and zinc, and even platinum might be believed, but little faith attaches to reports of such discoveries of precious or rare metals in the unaltered Carboniferous and Jura-trias of that plateau. Another recent discovery announced from that region is to the effect that a bed of sandstone 600 feet in thickness was found to be gold-bearing, and that owing to the coarseness of the gold it was found difficult to arrive at its correct average value per ton. It is almost needless to say that nothing of the kind exists there.

Within the past few months almost every deal for copper property has been announced as in the interest of the Amalgamated Copper Company. While that organization may be interested directly or indirectly in some of these deals it is not in all of them. When the Santa Rita mines in New Mexico were sold several months ago it was reported that the Amalgamated Company were the buyers. It has now developed that such is not the case. Another absurd report is now afloat to the effect that W. A. Clark is at the head of a syndicate that will buy control of all the copper mining companies in the country. A moment's thought will determine the improbability of any person or syndicate consummating such a transaction. The present price of stocks in the leading copper mines of the United States, taking no note of the large number of smaller mines, places the aggregate value of the leading mines at over $350,000,000. This sum would be swelled very materially by the addition of the numerous smaller but still valuable and producing mines—to at least $450,000,000. Such a combination of copper interests as is suggested is not likely to materialize.

No field presents a broader range for inventive genius than electricity. But a few years ago electricity was little known and but trivial application was made of the subtle force which to-day is seen everywhere. Step by step it has gone onward, each new success inspiring the tireless workers to new and greater endeavor. In more than one city of the United States fortunes were sunk in the earliest electric railways, which were unsuccessful. Now this means of applying power to city railways is all but universal. The first transmission plants were disappointing and far more expensive than the installment of similar capacity under like conditions at the present time. Forty thousand volts are now to be transmitted over ninety miles, and it is not unlikely that not only the amount of power but also the distance over which it may be transmitted will soon be greatly increased. What may come of experiments in wireless telegraphy can only be surmised.

At this season of the year the claim jumper is examining the public records and is on the lookout for valuable claims upon which the assessment work has not been done, therefore it behooves claim owners to make haste and take advantage of the few remaining days of 1899 to complete their assessment work on claims thought to be valuable enough to warrant the expense.

Concentrates.

ELECTROLYTIC COPPER has recently sold as low as 16¼ cents.

AT Dawson, N. W. T., the gold royalty to Nov. 1st amounted to $730,680.

WET CRUSHING has superseded dry crushing in the cyanide works at a number of places.

NORTH CAROLINA is credited with having produced about $20,000,000 in gold from her mines.

SOME of the ancient river channels of California have paid several hundred dollars per running foot.

THE difference is in the locality; the Kootenai district is in Idaho; the Kootenay district is in British Columbia.

IN '66 both gun cotton and nitroglycerine were tried experimentally at the Hoosac tunnel—the latter with great success.

THERE is a traditional story to the effect that rock blasting with powder was first introduced in 1130 in the mines at Rammelsberg.

IN South Africa the treatment of slimes by the cyanide process requires from eight to ten tons of liquid to treat one ton of slimes.

THE first ore shipped from any Aspen, Colorado, mine came from the Chloride mine in the spring of 1881. The freight charge was 6 cents per pound.

IN eastern Maine are a number of copper mines which have long been idle. They are now to be reopened. In the same vicinity are silver and mica mines.

METALLIC MANGANESE is of rare occurrence, although the oxides of the metal are important commercially. The ore is used chiefly in the manufacture of ferro-manganese.

AS EARLY as 1085 the Greeks are credited with making and employing explosive compounds, and firearms were said to have been first used in a sea fight occurring in 1098.

THE Alaska-Treadwell mine of Alaska pays dividends amounting to about $1000 daily. The Homestake mine of South Dakota pays $3500 daily in dividends. Both are low grade.

IN some veins where the dip varies, frequently giving the walls of the vein a waving form, enrichments are often found on the flattened part of the vein. These are called floors.

THE new shaft on the Tamarack copper mine, Lake Superior, is down 3800 feet and will reach the conglomerate at about 4500. The Red Jacket shaft of the Calumet & Hecla mine is about 500 feet deeper than this.

THE principal ore deposits of Ouray county, in the San Juan country, Colorado, are either in the eruptive rocks of Tertiary age or in the sedimentary beds underlying them. The eruptive rocks are chiefly andesites.

GALVANIZED IRON TANKS have been successfully employed in the cyanide process in El Dorado county, Cal. A description of this plant and its operation appeared in the issue of the MINING AND SCIENTIFIC PRESS of Oct. 28th, '99.

THE name Cerro de Pasco is of Spanish origin, meaning Hill of Pasco, the latter being evidently a proper name, the meaning of which is obscure, but evidently having no connection with the word pasqual. Cerro alone means hill.

A MIXTURE of corundum and magnetite (emery) occurs in irregular pockets in marble in numerous localities in Asia Minor. These deposits have been extensively worked. Some of the deposits are 200 feet in width and 300 in length.

RECENT experiments have shown that by careful roasting many of the rebellious ores of Meadow Lake, Cal., are made to yield from 70% to 95% of their assay value, though there are some ores which can not be worked at a profit by this method.

SOME eruptive rocks, such as quartz-porphyry, rhyolite, etc., and also some limestone and quartz, when struck with a hammer or with another rock, emit a peculiar fetid odor. Quartz possessing this peculiarity seldom contains gold in paying quantity.

THERE are several kinds of "day." For general purposes a "day" may be considered as the interval between two successive passages of the sun across the meridian—the time which elapses after the sun is exactly in the south before it again is seen in that position.

IF chloridized ore is brought into rapid contact with a suitable volume of solution of sodium hyposulphite in motion, the silver chloride quickly dissolves. It is thought that it is the volume of the solution more than its concentrated state that produces this result.

THE next meeting of the Lake Superior Mining Institute will be at Iron Mountain, Mich., beginning February 6, 1900. The leading topics suggested for the meeting are: "Improvements in Mining Methods and Equipments," "Reduction of Costs," "Keeping Cost Accounts."

THE tailings of the Montana Limited (Drum Lummond) mine at Marysville, Montana, are said to be the most refractory of any ever subjected to the cyanide treatment. They contain sulphides and carbonates of copper, ruby silver, arsenical polybasite and tetrahedrite, and are also low grade.

THE Nevada State Legislature granted a franchise to the Sutro Tunnel Co. in February, '65. Work was commenced on October 19th, '69, and connection was made with a shaft from the Savage mine July 8th, '78. The total distance from the mouth of the tunnel to the Comstock vein was 20,016 feet.

THE ore bodies in the Red Mountain district in Ouray county, Colorado, occur as shoots or chimneys in the andesite, along lines of fracture, and are of great depth and with a varying dip. These ore bodies upon exploitation proved very erratic and were not found confined to any particular horizon or plane.

AN aneroid barometer is a mechanical arrangement of great delicacy, used for the purpose of measuring the pressure of the atmosphere. By its use the relative altitude of different places may be determined. A large number of readings should be taken of any particular place and the mean reading accepted as the correct one, for the reason that atmospheric conditions change frequently, the daily variation amounting to considerable. The word aneroid means without flow or fluid (without mercury).

WHERE the floor of a drift is too soft to support the posts of a timber set, sills should be laid on the floor, the posts being placed upon them. A drain may be provided, if there is a large amount of water to be carried away, by elevating the track upon sprags extending from post to post. The sprags may rest upon short legs.

IN the operation of the cyanide process where the material treated contains sand and slimes great difficulty has been found in getting a uniform distribution of the material in the leaching tanks. There is a constant disposition on the part of the slimes to segregate into floors or layers, which is detrimental to the progress of the work.

THE expansive force of freezing water in rocks is equal to the weight of a column of ice a mile high of the same base area—about 150 tons to the square foot. One centimeter of water at 0° C. occupies 1.0908 cm. in the form of ice at 0° C. It is this expansion of about one-tenth that disintegrates rock when the water confined in the interstices solidifies.

BUT twenty-nine days remain in which to do unfinished assessment work for '99 on unpatented mining claims. Claim owners are out in force this month, saving their locations by energetic work long delayed. While thus engaged it should be remembered that two assessments can now be performed—the first $100 worth in 1899 and the second $100 worth in 1900.

IN the early history of mining the ancient miners used frequently to wave blankets or sheets in a vigorous manner to drive out foul air or gases. The same thing is still not infrequently done. Rapidly lowering and raising the bucket in a shaft will sometimes displace foul gas by the creation of a current of air. Showering water down a shaft also sometimes has a similar effect.

THE rights secured by the location of mining claims pursuant to the provisions of statute and the land office regulations are property rights, and are recognized and protected as such. Such property may, without infringing the title of the United States, be sold, transferred, mortgaged and inherited, prior to patent. Mining claims are not subject to the wife's dower.

WHEN excavating a cut for the commencement of a tunnel the cut should be carried into the hill a sufficient distance to give solid rock overhead at the mouth of the tunnel. Failure to do this results in the caving of the mouths of many tunnels within a year of their commencement, which entails additional expense. If snow drifts into the cut timber sets may be put in the cut and the whole lagged and covered.

THE typical Mexican smelting furnace, called horno castellano, is a shaft in an adobe wall lined with stone, which will stand a high degree of heat. It is approximately square. It has a single tuyere, and the furnace is about 5.5 feet in height from the mouth to the tap hole. The bottom of the furnace has a slant forward. A shallow basin is scooped out in the earth in front of the tap hole, into which the molten metal is run.

AS lands which are essentially mineral in character can not be the subject of appropriation under the homestead laws, but may be appropriated under the mining laws, an entry within the limits of a homestead claim, for the purpose of initiating a mining right, may be made at any time prior to the issuance of the final certificate to the homestead claimant, if such entry be made in good faith and without force or violence.

THE law requires $100 worth of work or improvement annually done for each unpatented claim. Where several claims lie in a group assessment may all be done on one claim, if the work so performed is for the benefit of all claims, but the notice of labor having been performed posted on the mine should state this fact, and a notice should be posted on each claim of the group, making a similar statement and setting forth where the assessment work has been done.

THE Canadian Parliament at Ottawa has passed an order in council providing that those who prospected for hydraulic mining leases in Yukon prior to December 3rd, '98, may make application for the same without competition on showing that they had prospected the same prior to the issue of the regulations on December 3rd, '98, when they were really not in position to know what action they should take. Under the present regulations application should have been made as well as prospecting done before December 3rd, '98.

THE fine distinction of law in high places is again finely exemplified by a decision of the Washington State Supreme Court on November 21st, discharging an "innocent" man charged with salting a mine at Bucoda, Wash., the evidence sufficiently showing that there was not enough mineral in the land so salted to constitute said tract mineral land, thus leaving unrestricted similar operations on the part of any one careful to discriminate between mineral land and land not likely to be so adjudged by Washington supreme jurists.

THE metal obtained from the Lake Superior mines is not "pure copper." The percentage of ingot copper varies somewhat. Following is a statement showing the percentage at the various mines:

Mine.	Per cent. ingot in mineral.	Mine.	Per cent. ingot in mineral.
Atlantic	75.009	Osceola	84.083
Calumet & Hecla	70.000	Quincy	79.489
Central	69.900	Tamarack	67.421
Franklin	81.107	Wolverine	87.681

THE district of Ballarat, Victoria, Australia, comprises two narrow belts running north and south. The eastern belt is worked for a distance of eight miles, that on the west for five miles. The formation consists chiefly of sandstones and shales. The veins are often accompanied by thin beds of dark carbonaceous shales called (locally) indicators. They are conformable with the inclosing slates and sandstones and stand almost vertical. These bands of shale are usually heavily charged with pyrite and arsenopyrite, the sulphide mineral sometimes becoming massive and replacing the shale completely.

THE general principle upon which dry-blowing placer machines are constructed is that of a box containing a series of slanting shaking screens of different mesh. The material is sorted in this manner and arrested by riffles, the finer stuff being blown away by the puffs of wind intermittently forced from a bellows attached to the machine. In Western Australia many of the dry washers are without bellows, the box being provided with supports or legs made of slender sticks. Two men are required to operate the machine, one to shake it, the other to shovel in the dirt. A strong wind, which usually prevails on the gold field, blows away the fine material.

THE gilsonite found near Fort Duchesne, on the Uintah reservation, Utah, is very brittle, breaks with a conchoidal fracture and is easily powdered. It fuses at a low red heat and burns with a brilliant flame. It is plastic when warm, and on cooling presents a smooth, lustrous surface, and is brittle; color, black, streak and powder dark brown; soluble in carbon bisulphide and in benzol; partially soluble in oil of turpentine and in ether; slightly soluble in naphtha and very slightly in alcohol. It occurs in several localities of that neighborhood. Some of it is impure from a mixture of sand.

WHERE it is desired to locate a tunnel claim under the United States laws the mouth or entrance of the tunnel may be on patented land, if said land be owned by the tunnel locator; or, if not, with the consent of the owner; or it may be located on an unpatented claim owned by others if consent be obtained. Then, if the greater portion of the projected line of the tunnel be on the public domain, the tunnel locator will obtain all the rights and privileges which arise under the tunnel location law; but the tunnel cannot be driven through any claim previously located without the consent of the owner of such claim. All agreements in matters of this kind should be in writing and witnessed and placed on record.

It was many years after their discovery that the telluride ores of the Black Hills of South Dakota were recognized as such and a suitable method of treatment applied, but prior to success in that direction large fortunes were spent in machinery and unsuccessful experimentation with various processes. In most of these some form of amalgamation was the basis of operations, and in more than one case not only were the gold and silver contained in the ore treated lost, but also the quicksilver, passing out on the surface of the tailings, so finely divided by sickening as to float. The tailings should have been impounded, but were not. Had they been they would have offered a rich reward to the successful cyanide workers of to-day.

WHERE the locator of a claim allows his title to lapse by reason of nonperformance of assessment work and the claim is taken up by another, all improvements made thereon and upon the claim at the time the second locator has perfected his location becomes the property of the second locator—any State laws to the contrary notwithstanding. The original locator has the right to remove any and all improvements while the claim is still in his possession; loses this right when his successor has taken up the forfeited location and perfected his location of the claim. Fixtures, including such improvements as engines, boilers, hoists, mills, or any other things of this character annexed to the soil for mining, become part of the freehold, and as such pass to the relocator.

IT has been suggested that the veins of California's gold belt are the result of accumulations upon an ancient beach similar to that at Cape Nome, Alaska. Such is not the case. The gold veins of California bear not the slightest resemblance to conglomerate or other fragmental deposits like those found on the Witwatersrand, S. A., or in the Black Hills on the Gustin belt. The veins of California are fissures cutting indiscriminately through sedimentary and eruptive rocks alike, and cut the slates usually in dip and also sometimes in strike. They possess none of those features which so clearly distinguish beach deposits. The ancient river channels approach more nearly to the conglomerates of the beach deposit, but they are distinctly river and not shore deposits.

THE proprietor of a vein or lode claim or mine, or the owner of a quartz mill or reduction works, may locate five acres of non-mineral land as a mill site. A notice should be posted thereon, which must contain the name of the locator or locators, the name of the vein or quartz lode or mine of which he is the proprietor or the quartz mill or reduction works of which he is the owner, the date of the location, the number of feet or acres claimed, a description of the claim by such references to a natural object or permanent monument as shall identify the claim or mill site, and by marking the boundaries in the same manner as provided for the marking of the boundaries of a placer claim. A mill site must not exceed five acres in area. The mill site may or need not be contiguous to the lode claim or claims for whose benefit the mill site is located. In applying for patent to mill site the mining claim and mill-site claim may be included in a single location. A square tract of five acres measures about 466 feet on each side.

OF tunnel locations, "Lindley on Mines" says: "Tunnel locations, or tunnel sites, as they are sometimes called, occupy a unique position in practical mining upon the public domain. They were not unknown during the period antedating the enactment of congressional mining laws. The discovery of a new mineral belt frequently gave birth to local rules upon the subject of tunnels, and it was by no means an uncommon occurrence for tunnel locations to be made on the four slopes of a mountain, their projected lines running into the hill from every conceivable point of the compass, and at different elevations above the mountain's base, from 100 to several thousand feet. Strife or litigation between surface locators and tunnel proprietors rarely, if ever, arose, for the simple reason that, according to the popular view, priority of discovery, whether from the surface or in the tunnel, established a priority of right." The Federal law enacted May 10th, '72, provides: "Where a tunnel is run for the development of a vein, or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within 3000 feet from the face (meaning entrance) of such tunnel on the line thereof not previously known to exist, discovered in such tunnel, to the same extent as if discovered on the surface; and locations on the line of such tunnel of veins, or lodes, not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel."

Phenomena Attending the Accumulations of Bitumen.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER, State Mineralogist of California.

The phenomena described in the succeeding pages are connected with the accumulations of bitumen as observed in California. All of these phenomena are generally found in one formation and so frequently together and in conjunction with bituminous deposits that it must be considered that one is the result of or is closely connected with the other, especially when it is known that one can produce or is the indirect effect of the other.

These phenomena would not be important in prospecting for a primary or stationary mineral deposit, but will be of great assistance in the discovery of a derived and migratory fluid such as petroleum oil.

When their influence, relation and position in regard to bitumens or bituminous deposits are determined and more generally understood, they will materially assist in the discovery and development of such deposits.

Red shales, earth subsidences, mineral and hot springs, leached shales and sandstones, silicified shales and sandstones, and accumulations of bitumen accompany one another and are traceable to metamorphic action.

Normal Shale.—This is an impure hydrous silicate of alumina. It contains about 20% alumina, about 70% silica, and in variable and small amount protoxide and carbonate of iron, lime, soda, magnesia, potash and other minerals, and organic substances.

It contains fossils in greater or less number, color usually dirty white to brown, but sometimes of other colors. It gives out an earthy odor when breathed upon, and is readily scratched with the finger nail. When wet with water it can be kneaded into a plastic mass. It is clay consolidated by pressure, and is capable of being split into thin layers along the original laminæ of deposition. When exposed to atmospheric influences it rapidly disintegrates.

Normal Sandstones.—When first deposited by water these consist of incoherent grains of silica of different fineness. The grains are more or less rounded by attrition, the result of their transport by water. They may contain fragments of other rocks, and they may contain in small quantities lime, magnesia, potash, soda, a number of other minerals and organic substances.

After deposition, the cohesion of the grains may be effected by pressure alone. They may contain fossils in greater or less number. Sandstones are of many colors.

Both shale and sandstone at the time of their deposition may be cemented by ferric, calcareous, siliceous or other material; but this cementation usually occurs subsequent to their deposition, when fresh or mineral waters commence to circulate through them.

Alterations in the shale and sandstone, effected by fresh and mineral waters, heat and in other ways, will be described hereafter.

The accompanying sketch and sections (Figs. 1 and 2) show a portion of the San Rafael mountains, situated in the northern end of Santa Barbara county, State of California.

The territory shown on the map includes an anticline with a northwest and southeast strike and having a metamorphic core. The unaltered rocks of the anticline consist of alternating beds of sandstones and shale, and the metamorphic rocks principally of cherts, jaspers and serpentines.

The metamorphic rocks shown in the diagram

FIG 1.

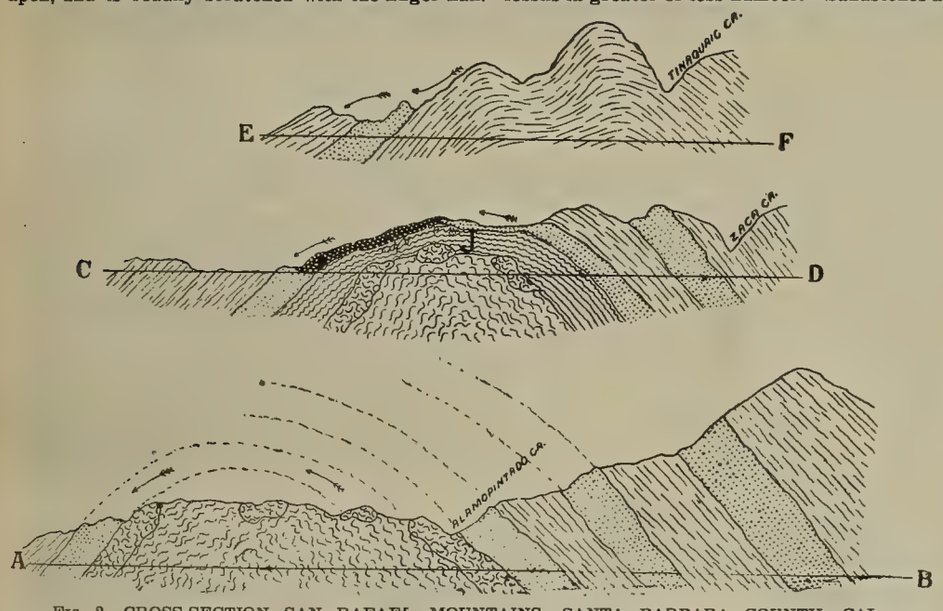

FIG. 2.—CROSS SECTION SAN RAFAEL MOUNTAINS, SANTA BARBARA COUNTY, CAL.

SUBSIDENCE LA BREA CREEK.

and sections once formed a portion of the unaltered shales and sandstones now forming these mountains. The unaltered strata have afforded casts of marine shells considered by Dr. Merriam as Pliocene.

The broken, bent, distorted and warped condition of these metamorphic rocks has been attributed to the movement of the mass after metamorphism has taken place.

The broken condition and intricate jumble of these altered shales and sandstones could not have occurred subsequent to their metamorphism. The chief cause of the disturbance of these rocks occurred before they were metamorphosed, owing to the contraction of the sandstone and shale. When burned to a jasper, the overlying rocks of Nature's kiln were continually falling and subsiding.

The face of a bluff of shale or sandstone in which subsidence is taking place is much different in appearance to the face of a bluff composed of these rocks which are being thrust upwards, or which are subjected to lateral pressure.

In subsidences of shale and sandstone numerous cavities are formed which are arched above, the rock having fallen from beneath the arch. When these arches break the cavities are filled with loose material.

These arched cavities do not occur in formations which are being uplifted. In subsidences, cracks in the rocks which approach horizontality are widened and the rocks fault on the cracks. These cracks are not widened in an upward thrust.

Subsidences are not faults; they usually form a centrocline and the depression is always greater at the center than at the periphery; many of the depressions are bowl-shaped and are called "ollas" by the Spaniards. Many of these depressions now form the beds of lakes. In the same area these subsidences are repeated many times. The entire area does not subside at the same time, and it is, therefore, greatly broken and crushed; nor does the movement take place at one time, but may continue for years.

By the time these shales and sandstones come in contact with metamorphic heat they are badly broken and contorted, owing to the action of subsidence, and they are further warped and twisted by the heat of metamorphism.

At a depth of 500 to 1000 feet the subsidence due to coal workings amount to about 50% of the thickness excavated; sometimes these subsidences continue during four years. The contraction in a formation composed of equal volumes of shales and sandstones when burned to a porcelanite is about one-tenth of its original volume. A formation burned to a depth of 1000 feet would give a subsidence on the surface of 100 feet in depth, or taking the amount of subsidence as is shown in coal workings, would give a subsidence of 50 feet in depth.

The red shales and porcelanites described in a former article by the author nearly always accompany these subsidences. If the interspaces existing in these red shales were filled with soluble silica they would become jaspers of many colors.

The presence of comminuted red shale in the oils at Summerland, Santa Barbara county, Cal., and the striking of red shales at the same place at a depth of 1000 feet, show that these shales exist at great depths.

Scattered throughout Santa Barbara county are over 1000 acres which have undergone subsidence, and some of which are still subsiding. The amount of depression is from 20 to 60 feet, with an average of 40 feet, and there may be many more acres which have undergone subsidence which have escaped observation, or which are or were not visible on the surface, or, if visible, all signs of the same have been obliterated.

Near the north line of the Sisquoc rancho on La Brea creek, Santa Barbara county, the bluff on the west side of the creek is over 300 feet high and over a mile long, and covers an area exceeding 300 acres. The entire bluff is badly broken and contorted and shows evidences of subsiding.

Chemical heat reddens and bakes and vitrifies the shales at the bottom of the bluff. The surrounding shales are blackened with carbonaceous matter. Fig. 3 shows the southern end of the bluff. Surrounding this subsidence are hundreds of acres of shales which have been silicified.

In the vicinity of nearly all these subsidences burned and leached shales and sandstones are found.

The breaking and contortion of the metamorphic rocks have been attributed to the dynamic force exerted in the uplifting and plication of the mountains. While this force is responsible for this broken and contorted state in part, the greater part must have been affected by subsidence and the warping of the rocks by the heat of metamorphism.

The curvature in the altered rocks is too acute and in the wrong direction, and the fragments of the rocks bent too small to have been made by the uplifting of the rocks.

Attending the uplifting and the metamorphism of mountains there must have been subsidences of the superincumbent unaltered rocks to fill the space caused by the contraction of the rocks through the action of heat.

The breaking and division of the unaltered rocks lying above and adjoining the places where metamorphic action is in progress facilitates metamorphic changes. It is like the placing of broken coals upon a fire, the interspaces between the pieces permitting the circulation of gases, minerals and heat.

(To be Continued.)

Motive Power for Mines.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by A. E. CHODZKO.

There is no occasion for entering into a detailed description of the mechanical arrangement of the plants, which will vary more or less in each case.

In a general way, and referring more particularly to moderate size installations, already supplied with hoisting, milling and pumping outfits, the oil engines will be so located as to belt with the countershafts at present connected to the water wheels or electric motors, clutches being provided whereby communication can be established or interrupted between the oil engine and the work.

With the possible exception of lengthening a shaft, and of putting up a clutch, a couple of bearings and a set of tight and loose pulleys, this arrangement will not disturb the existing machinery; the oil engine itself can be used without alteration, and such as it is, sold, the motor intended for the hoist being of the marine reversing type, if it is desired to run both ways, and if not, being, like all the rest of the motors, an ordinary engine for stationary work. The cost of creating emergency power is thus reduced to a minimum, all the component elements being standard articles.

The number of oil engines to be used will be determined by the relative location of the various portions of the plant. In a general way, it is safe to say that the mill should have an independent motor, as it must be kept in activity regardless of the fluctuations of power in the other departments.

But not unfrequently the same motor will do for operating the hoist and the air compressor, more particularly so if water is bailed out on the night shift, and if the rock drills are used for stoping, because then the various natures of work can be so arranged as to come in succession, or at least so as not to overlap one another to an inconvenient extent.

The motors should not be multiplied without necessity; at the same time, in no ordinary circumstances will it be advisable to throw all the work on a single engine with disconnective attachments, because first this would frequently work at part load, which is not economical, and then, it would be repeating the objectionable features of a single source of power, which have previously caused the suggestion of an emergency plant.

The installation will be complemented by one or more oil tanks connected to each motor by piping: unless the oil has to be hauled from a long distance and over bad roads, thus making the regularity of supply during the stormy season a matter of uncertainty, one or two weeks' supply should be sufficient for all practical purposes. The danger of fire, which is an important factor with gasoline, becomes quite secondary in the case of crude oil.

If, as previously hinted at, arrangements can be made for pumping the oil from the nearest railroad station or from some other convenient point, a small pumping station must be established at the point of supply, consisting of a direct acting pump operated by steam, or of a pump of proper description, according to the lift, and actuated by belt from an oil motor. The cost of such a plant, even for a considerable power developed at the mines, is quite moderate, and that of its operation will appear further on, when numerical examples will be considered.

As to the cost of the pipe line, only general remarks can be offered, as local convenience and conditions will have to guide in the details. A small size pipe, say 2½ inches, will carry 11,000 gallons of oil in twenty-four hours at a distance of fifteen miles, which would suffice for an aggregate H. P. of 4600.

In the mining sections of California, where very severe cold is seldom of long duration, the fluidity of crude oil will not be affected to any troublesome degree, and even should its viscosity increase noticeably, this could be corrected by the temporary admixture of a moderate amount of some lighter oil.

The pipe line need not be buried deeper than necessary to protect it against injury from falling rocks, or from the contact of passing vehicles or animals, and since the pipes are light and their screwed joints easy to make, laying a line of this kind should be a rapid and comparatively inexpensive work, and if properly done, the cost of maintenance of the same will be small.

If each mine owner had to build his own pipe line, there is, of course, a limit of distance in each particular case, beyond which he would find the undertaking an inadvisable investment, its convenience and economy of operation notwithstanding.

But we are here considering the case of a number of power consumers drawing from the same water or electric supply; and it naturally occurs that association may be the right step in the contemplated construction of an oil-pumping outfit; or else, if objections exist on the ground of joint ownership, private enterprise, acting as contractor for the conveyance of oil to several mines, might offer a solution of the problem.

In some mining regions the railroad passes at a sufficient proximity from the mines to make the individual establishment of an oil-pumping outfit accessible to a number of them; so that the foregoing remarks are about as much as can be said in a general way.

Coming now to consider the case of a deep shaft, where the hoisting speed is greater, the loads heavier and where a greater elasticity of movement is more desirable than in a smaller mine, it has been previously suggested that connection to or disconnection from a constantly moving motor did not present the guarantee of perfect control of the load possessed by a double-acting pressure engine, and that the proper arrangement consisted in interposing, so to say, compressed air between the oil engine and the drum of the hoist.

In other words, the oil engine should actuate an air compressor, discharging into a receiver, from which a compressed air hoist would draw its motive power.

This seems to introduce into the proposed plant an element of complication and of consequent greater cost; and so it does, in so far as the first cost of the installation is concerned. All that can be said about it is that special requirements call for special appliances, and for a correspondingly increased outlay. It will be shown, however, that this necessary evil is compensated for by a still higher degree of safety in the hoisting plant; and the operating expenses differ but little from those consistent with the direct driving of the hoist by an oil engine.

In this case air compressor and air motor are in close proximity; hence, no loss of efficiency is incurred by pipe friction; and, besides, the necessary reheating of the air used in the motor is effected at no expense by the exhaust gases of the oil engine actuating the compressor.

A similar arrangement has been in operation at a mine in Calaveras county, Cal., since 1898, but there the prime mover is an electric motor, operating an air compressor, and the reheater is a steam boiler, which, when acting in the former capacity, is only under moderate fire, to sufficiently evaporate what water is carried away by the compressed air, which is both heated and saturated in its direct contact with the water in the boiler.

Should anything happen to the electric motor, the piping has been so arranged that the air engine of the hoist can be quickly transformed into a steam engine; the only thing to do in that case is to push the fire under the reheater, acting now as a regular steam boiler, so that the increased elasticity of action due to the use of an air hoist is here combined with the advantage of having an emergency plant.

This installation is said to be very successful, and, under the existing local conditions, more economical to operate than when the electric motor was directly attached to the hoist, and it can appropriately be quoted in the present case, because, like the oil engine, the electric motor must be run at practically constant speed, having, however, this relative advantage that it can be started and stopped without difficulty.

At the time of the recent fire mentioned at the beginning of this article, the mine in question was enabled to continue operations without interruption.

Should an air hoist be operated by means of an oil engine, with a similar system of reheating, the boiler would be heated by passing the exhaust gases from that engine through the flues, the compressed air receiving, if necessary, a preliminary heating in the cylinders' jacket, and, in that case, the degree of safety would be two-fold, as regards the regular motive power of the mine, there being a joint emergency plant with the oil engine, and another with steam, for the hoist alone. There seems to be no question, therefore, regarding the satisfactory working of this arrangement, the economical conditions being still more favorable than in the case mentioned.

Several questions now arise, as, for instance, whether a special compressor should be attached to the hoist, or if the same machine should supply compressed air to it and to the other services of the mine, as well.

Again, what would be more desirable for the hoist—the ordinary system of compression or of the double-pipe arrangement, which in a case like this, would retain its advantages, while its defects would be much attenuated; also, whether dry reheated air should be preferred to saturated air?

The treatment of these and other points would unduly extend the scope of the present essay, whose main object was to call attention to some practical means of warding off the consequences of a failure in the motive power of a mine from natural or accidental causes.

(To be Continued.)

Indicator Veins.

The subject of "Indicator" or companion veins is an interesting one and there is little literature on the subject, but that these occur is a well-established fact. A correspondent of the London *Mining Journal* of a recent date gives the following interesting description of what he designates an "Indicator" vein:

One of the leading quartz veins of the Ballarat group extending in one direction toward Buningyong and in the opposite trend toward Creswick, has the singular—almost phenomenal—characteristic accompaniment of a small parallel vein of about 4 or 5 inches in width, known as the 'Indicator' vein. The main vein is 8 or 10 feet wide and carries a fairly remunerative percentage of gold, but the small vein above referred to—encased in a black slate—is a miniature 'Bonanza.' It is unique in formation and unrivalled as a gold producer. During the twin development between Ballarat and Buningyong, a distance of nine miles, the dwarfed Comstock has evolved a problem unsolved in auriferous deposits. It has often shown a matrix of wholly precious metal, the silica being displaced by entire gold, no vestige of the gangue initial matter being left. I well remember, about thirty years ago, seeing a pendant of pure gold in egg-sized lumps, united by a thin, wire-like chain of about 4 feet long, and of the value of £1500, taken from a depth of 250 feet on the 'Indicator' lode. What are called 'bunches' of gold are frequent, and it is difficult to tell when they take their departure. The uniformity of the lamellar structure of the enclosing black slate has only to be seen once to be ever remembered after. The distance of the two veins one from the other is no more than about 30 or 40 yards. In the first stage of quartz mining in Ballarat for gold, a mine known as the Black Horse Company was the pioneer mine. I have observed the same two veins on the north or Creswick side of Ballarat, but no development was being prosecuted. A large portion of the Ballarat group of veins is hidden from view by surface-covered basalt.

In San Bernardino county, Cal., in the Lava Beds district, thirty-six miles easterly from Daggett, occurs an interesting instance of companion veins. In this case the two veins are wholly unlike in structure, in character of the minerals and in value. But one of these veins is developed to any great extent. The formation in this portion of the district is a typical quartz-porphyry. In this a fissure has occurred of considerable longitudinal extent. It is a single, simple fissure, remarkably straight in strike and dipping nearly vertical. On the hanging wall side of this fissure, at irregular intervals, occur zones of crushed quartz-porphyry, which have become the repository for minerals derived from solutions rising along the fissure from great depth.

The largest of these deposits of ore has been exposed by a large open cut, a shaft and several crosscuts. In this ore body the original porphyritic structure is still clearly distinguishable in those portions of the deposit lying along its outer edges, the ore passing over by gradual transition to normal county rock. In the heart of the ore deposit and near the fissure the rock has been completely altered, however, the result being a more or less complete change in its mineral and physical condition. The porphyry is found silicified to a hard quartzose or jaspery rock and the feldspars have become kaolinized. Where are found the most complete crushing and pulverization of the normal rock, there may be observed its greatest alteration, with the formation of the largest amount of ore. In the brecciated portions of the mass the ore occurs as incrustations on the angular fragments of rock, and filling more or less completely the interstitial spaces, and to some extent the ore is found penetrating the rock fragments themselves as impregnations.

The normal deposition of the ore was in the form of sulphides, chiefly of iron, lead and copper, with gold and silver. The secondary minerals resulting from the oxidation of the sulphides are chiefly interesting for the variety in which they are found. In a single piece of this ore, not more than twenty pounds in weight, may be seen hematite, limonite, magnetite, malachite, azurite, chrysocolla, cerussite, wulfenite, manganese oxide, chloride of silver, quartz, kaolin, calcite and gold.

Along the fissure plane the line of demarcation is very plain, but on the opposite side of the deposit the metallic oxides gradually become less noticeable and a bleached grayish-white rock passes over to the normal quartz porphyry. The ore does not penetrate the foot wall. This ore body is 200 feet long and about 30 feet wide at its widest place, thinning out irregularly toward the ends and also apparently downward, being a typical illustration of the chambered vein of Dr. G. F. Becker, this surface deposit being what he designates as the cap chamber.

The principal value of the ore is in gold, and this occurs from a trace to several thousand dollars per ton. One cannot distinguish by the physical appearance of this peculiar ore between a piece almost destitute of gold and one rich in the metal, unless the gold can be seen, which is rarely the case.

On the south side of the ore deposits occurring along the fissure, and of which that above described is a type of all, lies a small companion vein—a fissure from a seam to 2 feet in width and extending over the barren desert hills for several thousand feet. It is but a few feet distant from the series of ore deposits above mentioned, in the same country rock and surrounded by the same conditions apparently, but is distinctly different. The gangue is quartz of granular texture and having a peculiar pearly luster resembling much the appearance of some varieties of gray lead carbonate, though this mineral is found very sparingly in the vein. Accompanying the quartz are found in minor quantities calcite and black oxide of manganese. Malachite occurs as an incrustation in the seams of the ore. Assays from this vein taken at various places show values in gold ranging from $50 to over $200 per ton, yet, strange to say, this vein has never received more than casual attention, no effort ever having been made to develop it.

The wide difference in the character of these veins so closely situated in the same rock formation seems to furnish additional evidence that the minerals contained in these deposits were not derived from the wall rocks themselves, but came from below, being carried upward in solution in the waters flowing along the fissures in which the deposits occur.

W. H. S.

Mining Conditions at Globe, Arizona.

TO THE EDITOR:—Globe mining district presents one of the peculiarities which have been noticed from time to time since the earliest history of mining, in this, namely: It was started in 1873 as a silver mining camp and was a producer of that metal before Leadville was known or Aspen was dreamt of, and has developed since into one of the best known and steadiest producers of copper in the country.

Strange to say, too, the first mining locations made were those of the Globe and Globe Ledge claims, now a part of the property of the Old Dominion Copper Co., the largest producer in the district. The transition from silver to copper was gradual and the district has not suffered by the change.

The district was organized in 1875 and the principal silver discoveries were made in the following year, when the mines at Richmond Basin—the McMillen and others—brought the aggregate of silver produced to upwards of $2,000,000. The first copper ore smelted was in 1877, by Venardsell & Garrish, in an adobe furnace at Wheatfields, twelve miles north of Globe, the ore being from the Hoosier mine, the result being forty tons of copper. The Hoosier is now the principal mine of the United Globe Mining Co., commonly known as the Buffalo and owned by Phelps, Dodge & Co. of New York, who are also the owners of the Copper Queen at Bisbee. Copper mining here was at first slow, owing to the wagon haul of 140 miles to Wilcox, and profit would have been impossible had it not been for the rich ores and simple process of smelting.

This property, which came into the possession of its present owners in 1891, has been a constant, although somewhat erratic, producer ever since. The present furnaces were frozen four weeks ago, resulting in the discharge of 200 men. Material for the construction of new, improved furnaces of a capacity of 250 tons per day is en route from the Colorado Iron Works at Denver, and it is expected everything will be in running order by the first of January, 1900, with from 200 to 300 men at work in and about the mine and smelter.

I am informed that there is a body of ore 46 feet wide on the 500 level, consisting of oxide, carbonate and sulphide of copper, and that the 600-foot level looks even better. E. H. Cook is the general manager and superintendent.

The Old Dominion Co. operated a small furnace in 1881 at Bloody Tanks, seven miles west of Globe, but the venture was a failure. The company's present furnace was started in 1882 on ore from the Globe mine, when there was no development other than a 20-foot hole and a tunnel, and the smelter has never since been shut down for want of ore, and every shaft and other opening is in better ore to-day than ever before in its history. The Bigelow–Lewissohn syndicate of New York have owned the property since June, 1895, during which time it has been managed by S. A. Parnall, under whose direction the main shaft has been enlarged from two to three compartments and carried down from the eighth level (430 feet) to the twelfth level, 850 feet below the surface. In ground supposed to have been worked out new ore bodies have been found, and there is at present ore enough in sight to keep the property running at its present capacity for years. In this case, as in many others, deep workings have proven that Arizona mines go down.

Owing to water, work below the eighth level has been impeded, but a new compound condensing pump of a capacity of 500 gallons per minute has been installed, and it is said the shaft will be continued to a depth of 2000 feet. A wire cable tramway conveys the ore to the smelter.

The success of the above-described properties, the advance in the price of copper, together with the advent of the Gila Valley, Globe & Northern Railroad, naturally stimulated the search for other copper ore bodies, and resulted in the opening of the Black Warrior, eight miles west of Globe. An inspection of this property showed that it had been opened in many places by tunnels and shafts to a depth of 300 feet, and there are ore bodies in sight variously estimated at from 175,000 to 195,000 tons of 8% ore. It is a silicious sulphide ore. Considerable ore was shipped from this property in 1897 and 1898, when the conclusion was reached that a large saving could be made by the erection of a plant upon the property for the reduction of this particular class of ore. To this end arrangements were made with the Colorado Iron Works, at Denver, Colo., for the erection of a leaching plant—the second of the kind in the Territory—which has recently been completed under the personal direction of S. W. Traylor. A successful test of the plant, which cost about $50,000, has been made; but the works are shut down at present, pending the sinking of a well for additional water—which they will have no difficulty in getting—and the lining of the pumps and tanks with lead, instead of asphaltum, arrangements for which have been made.

The furnace of this plant is a reverberatory, 9x16 feet, lined with firebrick. Above the refining furnace is the leaching plant. First is the boiler house with two 50 H. P. marine boilers, condensers, feed pumps and air receiver; next is the engine room, with a 100 H. P. Corliss engine and a compound air compressor capable of compressing air up to 150 pounds to the square inch.

On the side hill above, the ores come in cars from the mines, is dumped into a bin from which it goes to a large Blake rock crusher, thence to another bin and from there through a set of rolls, weighing seventeen tons. From these the ore is raised with an endless belt elevator to a revolving screen, then through another set of high-speed rolls weighing 16,000 pounds. The ore is again elevated to revolving screens and is carried by a horizontal endless chain conveyor to any one of the tanks. These are twelve in number, holding twelve tons of ore each; they are all suspended on trunnions with worm-screw gearing, so that they can be dumped when the pulp has been leached.

After the copper is in solution it is conveyed to a solution tank and drawn into precipitating tanks, in which revolve large copper drums, containing scrap iron to precipitate the copper. From this the precipitates are taken to the refining furnace.

The tailings from 10% ore, after leaching, resemble barren, coarse sand and assays less than 1% copper. Mr. Fleming claims that by this process copper can be made for 6½ cents per pound. The capacity of the plant is 100 tons of ore per day, which, it is said, can be mined and delivered to the plant at a cost of $1 per ton.

Just beyond the Black Warrior Copper Co. property, the Donnellan Copper Co. are developing a group of claims owned by a Philadelphia syndicate. H. A. Fry and J. Wright, members of the syndicate, are now visiting the property. D. F. Morgan of Minneapolis and J. T. Donnellan of Globe are opening a property on Mineral creek, near the Ray Co.'s mines. The payrolls of the companies, when running to their full capacity, amount to about $75,000 per month.

Several of Globe's citizens are developing copper prospects in the "Strip," twelve miles south of San Carlos. Among them are Mr. Jones, Gen. Supt. of the G. V. G. & N. R. R., who is interested in the Copper Bell; W. M. Williams, Dr. T. S. Collins and others.

Capt. W. J. Nicholson, Indian Agent at San Carlos, is on his way to Chicago to close up two sales of properties on the "Strip." One, the Olympia group, in which J. Lillie and M. Flaherty are his associates, has been sold for $30,000; the other, the Amazon group, in Hawk canyon, consisting of nine claims, brought $50,000. The purchasers are Detroit people, said to be interested in the Calumet & Hecla mine.

K. R. CASPER.

Globe, Ariz., Nov. 20th, '99.

IN the issue of the 11th ult., on page 550, in the illustrated article on "belt conveyors," the cut "Fig. 5" was inverted.

A Non-Technical Account of Wireless Telegraphy.

The fundamental principle on which space telegraphy—"wireless telegraphy"—rests was first noted and mentioned by an American—Prof. Jos. Henry of Washington, D. C., in 1842. He was experimenting with an old-fashioned electrical machine—one of the revolving-glass-plate sort which makes sparks. He was passing the sparks from this machine through a long iron wire shaped into a coil. He observed that every time a spark jumped there was marked evidence of electrical action in another coil some distance away. He placed this second coil in the basement of the building, three stories below the room where he was at work, and even at that distance the action in the second coil was "strong enough to magnetize needles." This was wireless communication on a 30-foot scale.

It is obvious that, if one phenomenon at A invariably produces another phenomenon at B, there must be some communication between A and B. It is impossible to conceive of one action influencing another action without some sort of connection. The connection may be roundabout, complicated or invisible; but it exists somewhere, or the second action could not occur.

Henry, therefore, knew that there was something which connected the two coils in his laboratory, or at least that there was something which they had in sympathetic communion. He called this something "an electrical plenum." Modern scientists call it "the ether." They mean the same thing. To name a thing, however, is not necessarily to understand it. Although one knows that the ether exists, and can prove its existence in various ways, none know else about it. There are some theories concerning it, one of which may be the truth; but, so far as accurate knowledge goes, the ether is at present one of the deepest secrets of nature. However, as it is through this ether that wireless telegrams are sent, it is necessary for the purpose of explanation to attempt to give some idea of it, or rather some idea of what it is believed to be. Suppose one imagines all space filled with a marvelous sort of jelly—a jelly invisible, imponderable, intangible and continuous—without a rift or break or crack in it anywhere, and further imagines this jelly to be of such a fine texture that it can and does penetrate between the very atoms of matter; that the atoms float in the jelly like a handful of currants in a real jelly, or like a handful of fine shot in a pot of semi-liquid tar. Then to still further imagine this unimaginable jelly to be so delicately elastic that a blow to it anywhere will shake it, not exactly in jelly fashion, but in "waves," one will have as good an idea of "ether" as most people have.

It is this "shaking" of the ether when it is disturbed that is here of chief concern, and of this there is no doubt nor question. A shock to it in any spot starts waves in it, something like the waves made in a smooth sheet of water by the dropping of a stone. These ether waves can be started in various ways; but, once started, they travel in a straight line in all directions from the point of shock, and always at the same speed—186,000 miles to the second. It is commonly said of them that matter is transparent to them—that is, that they will pass through all substances as light passes through glass. This is not strictly true. The electrically started waves now being considered may be deflected, and perhaps actually stopped, by some forms and conditions of matter; but such things as house walls, trees, water and hills do not seem to affect them at all. If the reader will remember the ether as an absolutely continuous jelly, he will understand why this is so. Extending as it does through all substances as well as through all space, a wall in the way of a wave will no more prevent its progress than the canvas wall of a tent will keep out noise. The ether wave passes through a wall as easily as a sound wave of air comes through the canvas.

These waves are really waves—actually, as it is believed, undulatory motion in the ether. Since Henry's discovery, and especially since the investigations made by Prof. Hertz of the University of Bonn (in whose honor they are usually called Hertzian waves), it has been known that they can be started in the ether, to put it rather crudely, by the passage of an electric spark under certain conditions. The jumping of an electric spark gives, as it were, a blow to the ether, which starts it trembling. Nobody knows why this is so, as yet, any more than anybody knows why your watch or knife will fall to the ground if you let go of them. To say "laws of gravitation" does not explain anything—it only names it. So, although scientists have theories of "stresses in the ether," caused by electrical charges, to account for the waves they can not tell yet why the stresses, any more than they can tell why the attraction of bodies.

Leaving the "why of it" to explain when it can be so explained, let us consider the simple fact. Electrical disturbances, like the passage of the spark, do give a blow to the ether, and that blow makes waves, and those waves will travel at the exact speed of light, nobody knows how far. Space telegraphy is performed simply by making these blows upon the ether and reading at the distant point the waves that come from them.

It has been found to be easy to give the blows by means of electric sparks; but how shall one read the invisible waves? An Italian—Calzecchi—supplied this answer. He discovered the principle of what has been named the "coherer," and a strange and utterly unexplained principle it is. The "coherer," simply described, is a little glass tube in which are two wires—two "terminals"—that is, the two ends of a broken electric circuit are brought together in this tube; closely, but not in contact. The space between them is filled with very finely divided silver and nickel filings—mere metal dust.

When one pushes a button to ring an electric bell, he simply presses together two pieces of metal, and thereby completes what was a broken electrical circuit. It is one of the characteristics of an electric current that it can not travel at all unless it can travel all the way around and back to where it started. That is a circuit. On the way it will pass through a bell or a lamp or a telephone or wherever it is given a path and do whatever work it has the strength to do. But if there is the slightest break in the metal path over which it travels, it stops altogether. A push button is such a break until pressed. So is a telegraph key. When pressed, the ends of the break are brought together and the bell rings or the telegraph sounder raps its message.

What has this to do with the coherer we were talking about? This, and it is the principle that has made wireless telegraphy possible: The two wires in the tube are the two ends of a broken circuit from an ordinary battery through an ordinary telegraph instrument. If they were brought together, the instrument would click out a dot or a dash, according to the length of time they were held together. But they are not together; they are separated by a very small space, and that space is filled with this fine metal dust, which is too hard a road for the current to travel with effect. But—and here is the key to the whole thing—whenever one of these Hertzian waves encounters the coherer in its flight, it appears to weld the dust together into a homogeneous metal conductor for the instant that it is passing. During that instant the current can pass with ease, and it is the same as if the two terminals were brought together. The current crosses from one wire to the other, the circuit is complete and the telegraph instrument sounds. When the wave has passed, the dust, at a tap on the tube, resumes its normal condition. It is just as if the coherer were a telegraph key and the ether wave the invisible finger that pressed it.

Marconi took all these principles, improved on their practical workings and added a discovery of his own. The combination is the practical Marconi system of to-day. Marconi found that the coherer would work better if it were exhausted of air. He also made the important discovery that the higher in the air he could make the blow to the ether, the farther its waves would travel with force. Nobody understands why this is so either, but it is a fact.

The Marconi sending device consists of a battery and an induction coil to make sparks with, fitted with a telegraph key to control their making. When this key is pressed, sparks fly. From one of the points between which the sparks pass, a wire runs up to a metal ball on the top of a mast. The pressing of the key in the room below makes a long or short succession of sparks from the induction coil. These result in a long or short succession of ether waves, which travel in all directions from the metal ball. In their progress they pass through the coherer at the receiving station perhaps fifty miles away, and occasion, according to their length, the record of a dot or a dash in the telegraph instrument.

The difficulty in the way of an extensive use of the present system may be understood when it is remembered that the ether waves travel with equal ease in all directions. Every coherer within the working radius of the sending station will respond to all waves: and if a number of messages were being sent at once from different stations, the confusion can be imagined. But Marconi is at work on a method of concentrating, or at least directing, the waves by means of a metal reflector, precisely as a light ray is directed by a mirror.

The speed of the sending is about the same as on an ordinary land line—fifteen to eighteen words a minute. The distance to which messages can successfully be sent is as yet under 150 miles, but the possibilities of the principles involved have no limits.

Experiments With Liquid Air.

At the annual meeting of the Austro-Hungarian Gas & Water Trade Experts, held at Vienna, Prof. Von Lang, Privy Councilor, demonstrated experiments with liquid air. The liquid air was stored in an open receptacle with double walls, the rim of which was covered with ice, in consequence of the difference in temperature. The double walls form a space free of air, as an effective guard against drawing on heat from outside to enable the air to be kept liquid for a lengthened period. The experiments were begun by filtering the liquid air first, and then the professor proved, by immersing a burning chip of wood, which burnt with a vivid flame, the prevalence of a considerable amount of oxygen. This is explained by the nitrogen evaporating quicker than the oxygen, which is found in liquid air to form 35% to 40%, while in the atmosphere it only forms 21% of the air. Poured into a basin of water, pieces of ice exceptionally cold are formed. If these pieces are picked up by the hand, or if the hand is only for a second dipped into liquid air, a sore is caused similar to that of a burn. If an India rubber tube is immersed in a receptacle with liquid air, it becomes at once as hard as stone, while flowers that were immersed got instantly so hard as to require a hammer to break them to pieces. Quicksilver fumes settled like a mirror on the inner walls of the tube when treated with liquid air.

The further experiments demonstrated the freezing, *i. e.*, liquefaction of pure alcohol, carbonic acid gas and acetylene gas, by conducting these through a tube into small glasses filled with liquid air. Acetylene snow burned with a beautiful yellow flame. A lead saucer containing liquid air, when struck with a hammer, produced a clear, melodious sound like that of a bell. The explosive powers of liquid air were demonstrated by igniting cotton wool and powdered charcoal saturated with liquid air, which flared up with great suddenness.—American Manufacturer.

A Magnetic Concentrating Plant.

The magnetic concentrator that has been used since January, 1898, at the Monteponi mine, in Sardinia, consists essentially of a fixed horseshoe electric magnet, placed with its poles downward. Below the poles is an endless rubber belt, a foot wide, at a distance that may be varied at will. A hopper feeds on to the belt a thin layer of the material to be treated, which is carried forward by this belt at a velocity of 1½ feet a second. In order to collect the portion attracted by the magnet, a second endless belt moves horizontally in a direction at right angles to the first, close to the poles of the magnet. The magnetic plant at Monteponi treats in twenty-four hours twenty-four tons of material, previously submitting to a reducing roasting. The material consists of silicate of zinc more or less ferriferous, limonite and zinciferous dolomite, materials of almost identical specific gravity. In the raw state the material contains on an average 22% of zinc, a percentage which is brought up to 30 by roasting. The magnetic concentrator extracts about a third of iron ore, assaying 10% of zinc, while the remaining product is brought up to 40% of zinc. By treating this product in hydraulic jiggers the lime and magnesia from the dolomite are removed, and the final product—oxide of zinc—contains 48% of zinc.

The Twenty Largest Steamers.

Following is a list of the twenty ocean steamers of more than 11,000 tons gross register:

Names.	Builders.	Owners.	Gross tonnage.	Length between perpendiculars, feet.
Oceanic	Harland & Wolff	White Star Line	17,274	685.7
Deutschland	Stettin Vulcan Co	Hamburg-American Line	15,500	657.8
Kaiser Wilhelm der Grosse	Stettin Vulcan Co	Nord Deutscher Line	14,349	637.4
Ivernia	Swan & Hunter	Cunard Line	13,900	580
Not yet named	Clydebank	Cunard Line	13,900	580
Patricia	Stettin Vulcan Co	Hamburg-American Line	13,000	560
Lacania	Fairfield Co	Cunard Line	12,952	601
Campania	Fairfield Co	Cunard Line	12,950	601
Pennsylvania	Harland and Wolff	Hamburg-American Line	12,891	560
Graf Waldersee	Blohm & Voss	Hamburg-American Line	12,830	560
Pretoria	Blohm & Voss	Hamburg-American Line	12,800	560
Cymric	Harland & Wolff	White Star Line	12,647	585.5
Grosser Kurfurst	Schichau	Nord Deutscher Line	12,500	584.3
Kaiser Friedrich	Schichau	Hamburg-American Line	12,480	581.5
Medic	Harland & Wolff	White Star Line	11,985	550.2
St. Louis	Cramp	American Line	11,629	535.5
St. Paul	Cramp	American Line	11,629	535.5
New England	Harland & Wolff	B. & N. A. St. Nav. Co	11,394	550.3
Afric	Harland & Wolff	White Star Line	11,188	550.2
Belgia	Harland & Wolff	Hamburg-American Line	11,100	500.3

Does the Presence of Organic Matter Cause Loss of Gold in Cyaniding?

Written for the MINING AND SCIENTIFIC PRESS by MATT W. ALDERSON.

In the MINING AND SCIENTIFIC PRESS for October 29, 1898, appeared an article by the writer, entitled, "Loss of Gold in Cyaniding by Volatilization." I was careful in wording the article, believing that the views advanced might provoke criticism. Instead, one or more persons seem to have expressed opinions coinciding with those set forth by myself. I have met persons whose experiences had been similar to my own, but who have not cared to make them public. The only exception that I have noticed was the following (MINING AND SCIENTIFIC PRESS, January 14, 1899), which may or may not have had reference to my contribution:

A Negative Opinion.

TO THE EDITOR:—Some time ago you had an article under the heading "Does Gold Volatilize?" I say no. If I may, I would suggest to the party who wrote the article to screen out all organic matter from his ore after becoming wet and assay same. I think he will be surprised, and can easily see where the gold went. T. K. CODE.
Steeple Rock, N. M.

I aim to accept a difference of opinion in a kindly spirit and am willing to follow out any thought suggested with actual work, and acknowledge myself in error if it can be proven that I am.

In the earlier works on cyaniding considerable of the discrepancy (when such occurred) between the extraction by the use of cyanide and the actual recovery was believed to be due to absorption of solution by wooden vats. There is weight of authority at the present time to prove that this supposed cause of loss is not borne out by facts. Bosqui, in his "Practical Notes on the Cyanide Process," page 127, says:

"Losses due to absorption have probably been much exaggerated. Such losses may occur in two ways: (a) By the mere retention in the wood of a certain amount of solution, varying between 20% and 40% of the weight of the wood; (b) by a series of absorptions, followed by evaporations, leaving behind each time a residue of gold—a state of affairs which may be assumed to obtain in leaching vats, which are drying while being charged, and in solution tanks, in which the height of the liquid is constantly changing. In the first case it is obvious that even if a large leaching vat retains in its staves and bottom so much as two tons of solution, it cannot absorb any serious amount of gold, unless the solutions be extremely rich. It would appear that the loss might be considerable if we assume the second theory to be the correct one. A series of tests carried out by the writer on the basis of these two theories of absorption showed that the second was hardly better than the first in accounting for any considerable loss."

When removing the vats used at the Grubstake mill, after the tailings there had been treated, I made a number of assays of the staves of the agitators and gold solution vats and found that the amount of gold they contained did not exceed in value the richest solutions with which the staves had been in contact. At Iron Rod a post which had stood all summer in a gold solution vat was assayed and found to be worth $6 a ton in gold. At the Mohegan mill, when checking work there, the insides of the vat staves were assayed and in no instance did they carry to exceed $4 a ton in gold. In the face of these experiences I confess I was not inclined to give the criticism of Mr. Code much weight. Nevertheless, I concluded the proper thing to do was to give him the benefit of the doubt, to investigate conscientiously and ascertain positively whether or not he was correct.

In running tailings from one yard at the Schmidt & John's mill at Silver Star, Mont., there was always a large amount of organic matter, such as roots of grass, willows, etc. Generally these are removed from the surface of the vat at the commencement of agitation. For experimental purposes they were allowed to remain during agitation, and agitation was continued for longer periods than usual, in some instances for forty-eight hours. Samples from different vats were then removed, dried and assayed. The amount of gold found was from $6 to $8 per ton, practically the same amount as was contained in the solution in which the material had been soaking.

In writing my previous article I had hoped that the relation of my experiences and observations would lead to investigation by others. I was not anxious for further work in that line myself, but it has seemed to have been necessary. I think I can demonstrate positively that the loss referred to is not caused by the presence of organic matter. But I have not carried my investigations to that point where I am prepared to say just what does cause it. Later I will give results of a number of experiments, and it is possible that investigations in progress may lead to some definite conclusion.

The writer is aware that the presence of charcoal floating in solution might account for a considerable loss of gold from such solution; as mentioned heretofore he met with loss in certain vats at Southern Cross from charcoal in tailings which had been run on ground covered with the charred remains of trees, and charcoal is known to be a good precipitant for gold. Tests made with it in Montana in the laboratory were invariably accompanied by good results, and the writer knows of its being used exclusively and satisfactorily for precipitating purposes by the El Paso chlorination plant at Florence, Colo. But aside from this, the conclusion is irresistible that the presence of organic matter does not account for certain losses of gold in cyaniding; such substances may take up gold to the value of the solution in which they may be placed, but not in excess of this, and they are not, and cannot be, in any case a cause of any considerable loss.

MINING, although depending for its greatest success on science, is still an extremely practical business which requires the best judgment and extended practical experience.

STOPE CARRIED TO SURFACE, NEW ALMADEN MINE, SANTA CLARA COUNTY, CAL.

Why Quicksilver is Up.

Quicksilver is higher to-day than in many years, being $10 per flask above the highest point reached in 1898. In 1874–75, when the great mines of the Comstock lode were using tons of the fluid metal, the price reached its highest notch, being $118.75. Although the successful and extensive introduction of the cyanide and chlorination processes has curtailed the use of quicksilver in metallurgical operations to a great extent, still the unusual activity in mining all over the world has kept up a constant and increasing demand for the metal in milling and placer mining, and its consumption in the arts is rather on the increase than otherwise. The great quicksilver mines of California continue to produce, but in much smaller quantities than formerly. However, the rising price of the metal, which has been going on for months, has stimulated production somewhat in the larger mines, and has also resulted in the reopening of old mines, some of which have been closed for years, and also in the discovery and opening of new mines. Within the past ten days a mine near Cloverdale, in Sonoma county, Cal., has made the first shipment of quicksilver produced in twenty years, and other mines, long idle, are about to resume production.

Commercially speaking, the quicksilver mining industry began in 1850. From that time to the close of 1898 there were produced 1,801,568 flasks, an average of 38,800 per year. The production lastyear was 31,092 flasks, and was the largest in the last ten years, being a notable recovery from the declining tendency in 1896 and 1897.

About a dozen mines are being worked in this State at present. The output for 1898 came principally from eight of these, as follows:

	Flasks.
Napa Con.	6,850
New Almaden	5,875
New Idria	5,000
Altoona	4,032
Ætna	3,450
Great Eastern	1,704
Great Western	1,150

THE FURNACES AT NEW ALMADEN, SANTA CLARA COUNTY, CAL.

The New Almaden is in Santa Clara county, Cal., but most of the other mines are north of San Francisco. So far the New Almaden has been the largest producer, though of late years it has been less prominent because of partial exhaustion of ore deposits. In 1865 the New Almaden yielded 47,194 flasks, the largest quantity produced in a single year by any mine in this country. At present there are only five of these mines on a dividend paying basis. The Quicksilver Co. of New York, owners of the New Almaden property, paid a dividend of 50 cents per share on the preferred stock last May, the first in some time. The last quarterly dividends

(paid October 2) were 30 cents for New Idria, 30 cents for Napa, 15 cents for Ætna and 10 cents for Boston. These companies should pay at least as much as the above for the current quarter ending December 31. Each of the above companies has its capital divided into 100,000 shares of the par value of $5 for Ætna and New Idria, $7 for Napa and $10 for Boston. The investment returns are 6⅔% on Boston, 9.60% on New Idria, 12% on Napa and 14% on Ætna.

A New Type of Desk Telephone.

Herewith is illustrated a new type of desk telephone adapted to connect with various different styles of interior and exchange services. The terminal block to which the line wires and conducting cord are attached also contains the induction coil, thus removed from possible injury, and the absence of which enables the desk part of the instrument to

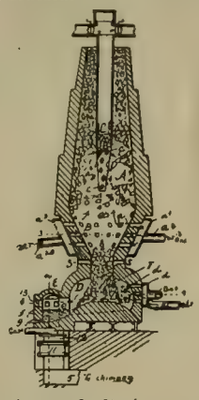
NEW TYPE OF DESK TELEPHONE.

be made in the neat and simple style depicted. The spring for the hook is flat instead of being of the usual spiral form, an innovation which will occasion greater strength to the apparatus. The transmitter is so attached that only two screws need be loosened to remove it from the standard, the terminals for the leading-in cords are on an insulated block in the base, and take the form of binding posts, rendering it unnecessary to unsolder any connections when renewing the cord. The instrument is made by the Connecticut Telephone and Electric Company of Meriden, Ct.

Gas Driven Electric Plant.

An interesting feature of the public service of Zurich and the neighborhood is the power plant at Oerliken, which furnishes current for the street railway lines. The installation at present includes one gas generator of 200 H. P. and two of 100 H. P. The generators burn Belgian anthracite from the Liege district. The gas is washed and passes through coke scrubbers and sawdust. No smell of tar is noticed, and no trouble seems to arise in the gas engines which, like the generators, come from the Maschinenfabrik Deutz. The three engines of 125 H. P. drive, each, a compound four-pole continuous-current generator for 550 volts, at 180 revolutions. A battery of 280 Tudor cells is connected in parallel to the dynamos. The regulating cells are changed by a motor-generator. Conspicuous on the switchboard is an automatic cell switch for cutting out the discharged cells. This apparatus comprises two heavy selenoids and appears to be used during night time only, hand regulation being adopted for the day service.

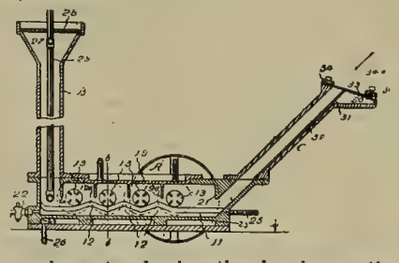
The guidebook furnishes the following information regarding this station, which belongs to the Zurich-Oerliken-Seebach system: Coal consumed per effective horse power of the gas engines, 0.65 kilogramme (1.4 pound); each train makes 161 kilometers (100 miles) per day; the line having a length of five miles and a rolling stock of twenty cars, of which, as a rule, only ten are running. With 3.2 passengers per car kilometer, the income is 43 centimes per car kilometer, and the cost amounts to 34.4 centimes.



DURING 1899 American manufacturers will have exported over $100,000,000 worth of iron and steel, which is $20,000,000 in excess of the sales of any previous year.

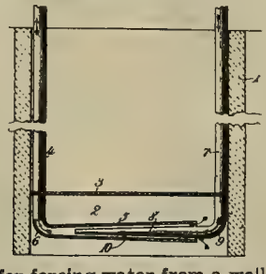
Latest Mining and Metallurgical Patents.

Patents Issued Nov. 21, 1899.



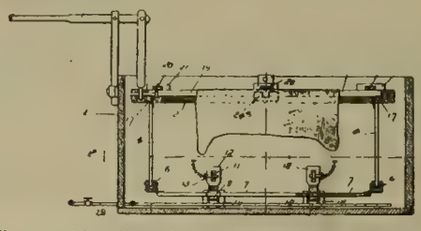
Specially Reported for the MINING AND SCIENTIFIC PRESS.

GAS BLAST FURNACE.—No. 637,432; D. Tschernoff, St. Petersburg, Russia.



A furnace having a shaft *A*, a contracted zone *B* with openings *a* therein, means for introducing hot gas to contracted zone, a pipe *C* in shaft having openings for the escape of gases, pipe *C* extending to the top of the shaft and having a suitable outlet, an enlarged hearth below the concentrated zone, onto which material descends from the shaft, inlets for air and gas to enlarged hearth, a side hearth slightly lower than the enlarged hearth and connected therewith by a passage, whereby melted metal from the enlarged hearth will pass to the side hearth. A furnace having a shaft *A* with openings *a* near the base of the shaft, a chamber on the exterior over openings, a pipe *P* from the upper part of the chamber to the interior of the shaft, toward the top thereof, and a perforated pipe *C* in the shaft, An enlarged hearth below shaft, means for introducing air and gas into the shaft at zone *B*, means for introducing air and gas to the enlarged hearth, a side hearth *E* communicating with the enlarged hearth below the shaft, there being regenerating passages for admitting air and gas to the hearth *E*, and exhaust regenerating passage from side hearth.

AMALGAMATOR.—No. 637,482; L. C. Park, Vancouver, Canada.



An amalgamator having the chamber sections *A*, *B* and *C* arranged so that water will gravitate therethrough, in combination with a longitudinal groove 11 arranged along the center of bottom of chamber *A*, the bottom of chamber on the opposite sides of the groove 11 being sloping upwardly from the groove to the side walls of chamber, and ribs 12 placed on the opposite sloping sections of the bottom at intervals and at right angles to the groove with their approaching ends terminating at the opposite edges of such groove; in an amalgamator having chambers *A*, *B* and *C*, vertical, horizontal and sloping, in combination with agitators consisting of groups of blades 13 fixed into solid end pieces 13^a, recesses 13^b in such solid end pieces, and detachable spindles 14 and 15 having their inner ends of angular form let into said recesses 13^b, the chambers *A*, *B* and the chamber *C* with the flared outlet 30 in combination with a depressable plate 33, secured at one side beneath a bar 34 and arranged to be depressed by the bolt 34^a on the opposite side.

A DEVICE FOR FORCING WATER OUT OF WELLS.—No. 637,694; A. Baca, Fayetteville, Tex.

A device for forcing water from a well comprising a plate secured in well above the water level thereof in a manner to afford an airtight compartment in the lower part of well, a pipe extending through plate and having a large horizontal portion submerged in the water of the well, and a second pipe extending through plate and having a reduced horizontal portion projecting into the enlarged part of first-named pipe in a manner to afford an annular space between the two and adapted to have an elastic fluid forced therethrough.

AGITATOR FOR LIMING VATS.—No. 637,685; E. Vockler, Wheeling, W. Va.

The combination of a vat, a rocking frame supported therein, two sets of pivoted agitator paddles supported in the receptacle, one set being near each end of the receptacle, the paddles thereof extending inward beyond the center of the receptacle and terminating near the pivots of the paddles of the other set, the paddles of the two sets interlacing between the pivots of the two sets, and a link connecting each set to the adjacent end of the rocking frame; a link hinged to and depending from each end bar of the rocking frame, vertically-moving cross bars pivotally hung to the lower end of links, paddles hinged to each of bars and extending inward therefrom, a fulcrum bar for each set of paddles, a retaining device for each set of paddles, the paddles of the two sets interlacing between the two fulcrum bars. The combination of a vat, two horizontal sets of agitator paddles therein, one set being pivotally supported at each side of the center of the vat, the paddles thereof extending inward and being pivotally supported about midway their ends, the paddles of each set alternating with and extending beyond the free ends of the paddles of the other set and means for rocking paddles on their pivotal point.

The Greatest Transmission Plant.

A Michigan company proposes to carry a current of 40,000 volts 90 miles, to Allegan, Kalamazoo, Battle Creek and Jackson, the last named of which is 90 miles from the dam. In the plant of the Southern California Power Company, built to carry electricity to the city of Los Angeles from a dam in the Santa Ana river above Redlands, a current of 33,000 volts is carried 81 miles.

The Kalamazoo Electric Company was organized two years ago for the purpose of converting the power of the Kalamazoo river into electrical energy and transmitting it to the surrounding towns. A dam has been built that will give a head of 32 feet, it being operated now at 19 feet. The lines to Kalamazoo, over 20 miles away, and to Allegan, nearly five miles from the dam, have been completed and are in operation, at present at a pressure of 25,300 volts. The voltage will be increased to 40,000 when the line to Jackson is completed, so that the talk about snatching the laurels from southern California may be premature.

The dam is provided with all modern improvements. There are eight turbines of the Leffel horizontal pattern, aggregating 3000 H. P. The generator is a three-phase alternating current dynamo of an improved type. Its voltage on full load is 2300, and its rated capacity in amperes on each phase is 377. Its rated horse-power is 2500, but the electrical ratings would indicate more power than that, and in the tests the machine showed up well under a load of 2700 H. P.

There are three mammoth transformers, 4 feet in diameter and 9 feet high. The current enters them at a pressure of 2300 volts and leaves them at a pressure of 25,300 volts. The pressure of this secondary current is eleven times as great as that of the current entering the transformers, but the quantity of current or number of amperes is only one-eleventh as great, and it can therefore be carried over the long lines on a much smaller wire than could a larger amount of current at a low pressure. This is the object of all transformer systems.

The transformers are of two kinds. The step-up transformer is one in which a large current of electricity of comparatively small difference of potential is converted into a small current of comparatively great difference of potential. The step-down transformer is one in which a small current of comparatively great difference of potential is converted into a large current of comparatively small difference of potential.

The long distance transmission of electricity through the conservation of power in mountain streams has cheapened greatly the cost of electrical energy to the consumer. The field in this direction will doubtless be extended considerably with the storage of water in the mountain districts, primarily for irrigation purposes, under National or State auspices.—Electricity.

Mining Summary.

ALASKA.

C. D. Lane of California is reported to be going into placer mining at Cape Nome on an extensive plan. He is this week credited with having placed an order for a pump and four miles of 18-inch pipe to cost $500,000. When asked if any of the other claim owners in the district contemplated building pumping stations to facilitate the working of their claims, Mr. Lane said: "It is a speculation at the best, and as soon as the pump is in working order, which will be within a year, they can really get as much use of the water as I can. As soon as I became convinced that it was necessary for the practical working of my claims to the best advantage, I left the country and placed the order for the pump. It will be in working order in a year, and until then the claims will have to be worked with the rude rockers now in use."

ARIZONA.

COCHISE COUNTY.

It is reported the Copper Queen Co. at Bisbee will close down their works in December to put in more extensive machinery and to increase their smelting capacity.

MOJAVE COUNTY.

The Yucca Cyanide, Mining & Milling Co. of Cedar district are receiving a plant of machinery which is being taken to the San Francisco mine, which has been a shipper of high-grade gold ore.

Stockton Hill and Cerbat, long in obscurity and idleness, are now among the most active mining camps in the county. The veins are fissures, continuous and high grade.

YAVAPAI COUNTY.

(Special Correspondence).—The new gasoline hoist for the Richenbar mine has arrived. G. W. Middleton, Mgr., expects to have it in operation in two weeks. Clarence King has been making an examination of the New York gulch gold properties. The G. E. M. gold mine is reported about to change hands. It is owned by Greenwood, Elliott & Miller, who are operating it with a steam stamp mill, it is said, profitably. The ore is crushed to twenty mesh. About $5 per ton is caught on the plates. The tailings are cyanided. It is claimed that by this combination 89% of the assay value is recovered.

Mayer, Ariz., Nov. 25th, '99.

The Senator mine, at the head of Hassayampa creek, is running its mill to fullest capacity. Development of the mine is progressing below the 600 level. This property and the copper mines at Copper Basin, eleven miles southwest of Prescott, are owned by Phelps, Dodge & Co. of New York.

J. S. Jones is to start up the Little Jessie mine in Chaparral district. It was formerly successfully worked by Frank M. Wright under lease. Mr. Jones is working the Union mine, one of the Jessie group.

It is reported that over 300 prospectors are in the neighborhood of Cataract canyon, 100 miles north of Prescott, in the alleged platinum fields. Exaggerated reports come from there to the effect that the beds are inexhaustible, the ore worth $300 per ton, and other similar extravagances. Conservative men doubt the existence of platinum there at all.

Prescott *Prospect*: J. W. Burrage of Montana, representing the Butte & Boston M. Co., has an option on thirty-two copper claims in the Black Rock district and is sinking a shaft on the Hanlan claims. The shaft is 200 feet in a body of rich copper ore. He has a large force doing assessment work on the other claims.——Carlisle & Co. have stopped work on their property, in Buck Horn gulch, which they bonded some time ago to a French syndicate, but expect to resume work in a short time. A steam hoist is being put in place on the property.——S. Powell is working the San Francisco group near the river. He will make a test run of 300 tons through the Lyons mill, which is near the mine.

CALIFORNIA.

Amador.

At the Zeila mill thirty-five of the stamps are crushing Zeila ore and five are working on Central Eureka rock.

Amador *Ledger*: Watkins & Co. have bonded a gravel mine near Pine Grove and operations have commenced under the direction of R. A. Watkins. The mine was formerly worked at a profit until there came a landslide too heavy for the owners to handle with the limited means at their disposal. Two pipe lines have been laid, one from the north and one from the south. The machinery for a 25 H. P. derrick has been ordered. In the mine is a large amount of cement gravel worth $4.50 per ton, and next season a 10-stamp mill will be installed to crush this. It is claimed that this cement can be worked at a cost of $1.25 per ton. The mine is 1¼ miles northeast of Pine Grove, at the head of Santa Clara gulch.

Calaveras.

The Sieffer property, at Stockton ridge, Mokelumne Hill, has been taken by a company which will reopen the long abandoned mine. In early days the Stockton Ridge and Corral Flat channels were very rich. It is claimed the early miners did not reach the channel, but were able only to recover gold from the rim rocks, and to determine this the new company will reopen the ground.

At the Big Bonanza mine, south of Angels, sinking is going on. At 300 feet rich ore was struck, some of which will go $2000 to the ton. The ledge will average 50 feet in width. The shaft is being sunk on the east vein. It is the intention of the company to erect a mill when the shaft has been sunk another 100 feet.

At the Gwin mine sixty stamps are dropping, the rains having sufficiently increased the water supply.

The Utica Co. have started the electric power at the Madison mill. The Stickle and Utica mills are to be similarly operated.

The long adit at the Melones Con. mine, near Robinson's Ferry, is progressing slowly, as the heading is passing through a reef of very hard ground. The estimated cost of the last week's work is about $20 per foot. The tunnel is perfectly straight and runs west of north; but as the formation swings from side to side, changes in the formation are not of infrequent occurrence. Crosscuts made from this tunnel will cut the numerous veins, large and small, in Carson hill, nearly 1000 feet from the surface.

El Dorado.

W. F. Lupold ground out $400 with an arrastra at his mine near Fairplay in thirty days, recently. The vein is 18 inches wide. He works without assistance.

In the Blue Gouge mine the discovery of a 6-foot vein of good ore in one of the lower tunnels is reported. The new milling plant is completed.

The Van mine, north of Georgetown, is to be reopened. It is now flooded. It may be found necessary to sink a new shaft.

Fresno.

From McKittrick, McKenzie & Griffith reported an oil strike in a well sunk 900 feet, northwest quarter, section 20, near Buena Vista. The casing of the well is 9⅝ inches, and when the drill entered oil-bearing sand the oil flowed 4 feet over the casing.

Inyo.

The discovery of a rich copper vein is reported near Death valley. The vein is 8 feet wide and is traceable over 10,000 feet.

Kern.

The Pioneer mine, near Johannesburg, has been sold by J. J. Miller to R. F. Harrison and others of Ballarat. A 10-stamp mill at Garlock has also been bought and will be moved to the mine.

An abandoned oil well on the El Dorado claim is reported flowing again, after a long period of unproductiveness.

Los Angeles.

In the case of B. Chandler against the State of California regarding the claim of Chandler to the southwest quarter of section 24, township 2 south, range 11 west, as mineral land, the Secretary of the Interior has decided that in order to prove that the land is valuable as petroleum-producing land, a well must be bored. Surface indications of petroleum are not to count as evidence of oil in paying quantities.

Mono.

The report of the Standard mine for the week ending Nov. 18th shows: Number feet drifts, 38; number feet drift cuts, 24; number feet raises, 41; number stopes worked, 21; number tons ore milled, 357; tailings assay, $9.72; concentrate assay, $210.30; number men employed, 112.

Mariposa.

A strike in the Mary Harrison mine of the Merced Co., two miles south of Coulterville, is reported. The Maxwell mill site has been bought and it is now reported the company will install a large electric plant. The property, it is said, has earned money every month this year except one, when the development work consumed more money that the mill took out, working on the old stock pile from the mines, but the prospects are that the Merced can be made a dividend paying mine. At present the company is taking out the ore above the 700 level blocked out some time ago. The shaft will be sunk 400 feet deeper. The company is now in control of the ditch. It has laid in its winter supplies at the mine and has left in its treasury $230,000.

Placer.

(Special Correspondence).—The head gangway of the Big Dipper mine, near Iowa Hill, broke into the works of the Morning Star mine Nov. 10th, 750 feet north of the main works of the Big Dipper mine. The distance from the mouth of the Big Dipper tunnel to the mouth of the Morning Star tunnel is 10,000 feet. The fact that the works of the Big Dipper and Morning Star mines are now connected, as well as thorough prospecting in northerly and easterly directions by the Morning Star M. Co. and the Big Dipper M. Co., proves conclusively that these two mines are operating in the same channel. Careful and extended observation also proves that this channel flowed in a general northerly direction—that is, from the mouth of the Big Dipper tunnel toward the mouth of the Morning Star tunnel.

The channel comes from the direction of the Forest Hill divide, possibly being the channel upon which the Paragon, Mayflower, Baltimore and Dardanelles mines operated, crosses Shirttail canyon and enters the Iowa Hill divide, from New York canyon, at the old Vaughn hydraulic claim at Wisconsin hill. From this point to the lines of the Big Dipper mine the channel has been laid bare by the hydraulic process and can be plainly followed. Its course is here about northwest for 2500 feet, thence easterly to the Big Dipper mine, 2500 feet, which it enters, turning to the north and preserving a general northerly course for 5500 feet to the line of the Morning Star mine, where it changes its course to the west, and preserves a westerly course to the mouth of the Morning Star tunnel, a distance of 4500 feet. At this point the channel crosses Indian canyon, where it is eroded, and passes under the town of Iowa Hill, turning to the north, and thence across the canyon of the North Fork of the American river, by which it has been eroded, to Gold Run and Dutch Flat. From the point of entrance at Indian canyon to the point of emergence into the North Fork canyon, a distance of about 4000 feet, the channel has been hydraulicked with the exception of a small strip upon which stands the town of Iowa Hill. The gross product of this channel, from the point of its entrance into the Iowa Hill divide to its point of emergence therefrom, has been about $7,000,000, or over $350 per running foot, for from 18,000 to 20,000 feet of the channel.

Shirttail, New York, Indian and North Fork canyons were very rich at the places where these canyons cut away the ancient channel.

Iowa Hill, Nov. 25th, '99.

The hanging wall ledge and the foot wall ledge of La Trinidad mine are being connected with a crosscut 700 feet in on the tunnel. The mine is in Sailor canyon, near the American river. It has a 10-stamp mill. J. R. Brokenshire is Supt.

J. J. Hoffman and T. M. Browne have applied to the California Debris Commission to mine by the hydraulic process at the Paragon gravel mine, Bath, to deposit tailings in Volcano canyon. The old hydraulic pit at the Paragon mine is supposed to be rich. It was extensively worked before hydraulicking was enjoined. It is on the same channel as the Mayflower and Dardanelles mines. This important channel enters the Forest Hill divide at Bath, flowing in a northeasterly direction, then sweeping around to the westward into the Mayflower, to the Dardanelles, where it is exposed in a hydraulic pit nearly half a mile long. Here it turns back under the divide, running directly north toward Yankee Jim's, but is lost under the divide, being cut out by a later channel. The Paragon and Mayflower workings are connected and are over five miles in length.

In the Hidden Treasure mine, at Sunny South, the rich Dam channel has been cut 5000 feet in on the main tunnel. It is 32 feet lower than the upper channel. The gravel is blue, the deposit 6 feet in depth and very rich, going as high as $5 to the car. A hoisting and pumping plant will be required. A drift will be run up the channel to develop it. The Hidden Treasure Co. employs 180 men. The mine has been paying monthly dividends the past five months. Harold T. Power is Supt.

Plumas.

Quincy *Independent*: F. Mandeville of Willow Ranch has washed a diamond from the volcanic sands and gravels in the vicinity of Nelson Point. The gem was discovered near the tail end of a sluice box in which a quantity of gravel had been washed. Mr. Lord, a jeweler, pronounced it to be a diamond. It is of irregular form, its greatest diameter being about one-fourth of an inch.

San Diego.

The Ranchita mine at Banner was recently sold at public auction by the Sheriff. The mine, with a lot of other property owned by Cave Couts, had been ordered sold by the court to satisfy a judgment for $8,300 obtained by C. A. Schrader against Mr. Couts.

The tunnel at the Kentuck S. mine at Banner has opened up rich ore, some of it running $200 a ton. The mine is owned by L. N. Bailey. The tunnel was run in from the foot of the mountain to the vein, over 800 feet.

The Encinitas Copper Mining & Smelting Co., recently incorporated, contemplate building a smelting plant on the line of the railroad, near Oceanside. The mine is four and a half miles from San Marcos.

The Alabada, near Banner, is working two eight-hour shifts.

It is reported that the Helvetia mine, near Julian, has been stocked and will be reopened.

The Owens mine, at Julian, has changed hands again, says the Ramona *Sentinel*. Denis Clark has bought out J. M. Risher of Pasadena. J. N. Large of San Diego is superintendent. A good chute of ore is reported at the 200-foot level; also at the 250-foot level.

Shasta.

(Special Correspondence).—F. G. King last week secured a bond for nineteen months on the Oun group of twenty claims near Copley for $45,000.

A new vein of fair grade ore was cut last week in the Capital mine, near Shasta, in a 350-foot tunnel.

Near French Gulch twenty-five leasers are operating the Washington mine and the output is said to be $30,000 a month. The ore is shipped to Selby's and to Keswick.

Redding, Nov. 27th, '99.

J. J. Kelley has made a strike of a 16-inch vein of rich ore in the Bulwer mine in French Gulch district. On the adjoining claim Driscoll & Chambers have a 6-inch vein of high-grade rock.

D. McCarthy is negotiating the sale of the Dry Creek Slide mine with Eastern people. The price is $55,000.

The Mayflower mine at Muletown, which was recently bought by Ormsby & Stoddard, is working. The vein has widened in the shaft to 4 feet of rich ore, some of which is shipping grade.

At the Bully Hill mine it is reported that an 800-foot drift has been run in sulphide ore. Crosscuts show about 40 feet of solid ore. The grade of the ore is not stated.

Siskiyou.

E. B. Edson has bought the Sullivan mine on Willow creek, near Gazelle, and is developing it.

Boston capitalists have been buying California gold mines within recent years. The latest investment reported is the Dwinell quartz mine, in the Gazelle district. This mine has been bought through E. T. Wallace of Yreka for $125,000. The Boston purchasers have had an option on the mine for several months. The property is reported to have a large vein of shipping ore. The new owners will put in stamp mills.

Tuolumne.

At the Black Oak mine, near Soulsbyville, it is reported that in sinking below the 850 level a new body of rich ore has been found. Some of the ore runs $300 per ton. For several years this mine has been shipping large amounts of ore to Selby at Port Costa, running $100 to $140 per ton.

The Shawmut-Eagle mine, half a mile north of Jacksonville, is running full force, 150 men employed and forty stamps dropping. The superficial detritus overlying the mineral zone east of the massive quartz cropping is being run through the mill, and is said to contain $7 per ton in gold, besides sulphurets. The management is considering the building of cyanide works.

The Dead Horse mine, at Carters, is unwatered and work in the mine has been resumed. The main shaft is down 1700 feet.

J. Joseph is cleaning out the old workings of the Ferguson mine, on Merced river. The mine was extensively worked in early days to the lower tunnel level, since which time it has been idle.

Dorsey & Frazer, working a pocket claim on Jackass hill, near Tuttletown, have taken out $6000 the past few days and claim enough in sight to make the amount $10,000.

The Alameda mine, near Tuttletown, which for three months has been idle, is to be started up. It has been leased to H. M. Donald.

Yuba.

The Priestly dredger has been launched on the Yuba river, near Smartsville, to be operated by a 75 H. P. electric motor, with power from the Yuba E. P. Co. In the dredger is an Archimedean screw 8 feet 8 inches in diameter and 72 feet long. The cost of the dredger is about $37,000.

COLORADO.

BOULDER COUNTY.

At Eldora the Mogul tunnel is being advanced on the west branch. The east branch has reached the Clara lode and rich tellurium gold ore is found. A vein in the west branch is reported to run $1000 per ton, and a 2-foot vein averages $60, and one of 3 feet, $40.

CHAFFEE COUNTY.

(Special Correspondence).—The present outlook for extensive development in Turret Camp this winter is flattering. The winters are usually mild and snow does not hinder work of any kind.

The Turret City G. M. & M. Co., of which W. J. Root of Chicago is president, has a plant of machinery on the ground ready to set up. A. G. Stephenson is superintending the work. The plant consists of a 60 H. P. boiler, 8x10 hoist and a No. 3 pump. Mr. Root says they will put the present shaft down 1000 feet, and will not do much development short of 500 feet. A shipment from the property returned $64.50 per ton in gold 1⅞ in copper.

A plant of machinery is now on the siding for the Nabob M. Co.

The Anaconda Co. have their plant up and running. The plant consists of 50 H. P. boiler, 6x8 hoist and a No. 7 pump. The plant is new throughout. The shaft is being sunk on below the 100-foot level, while crosscuts and drifts are being run from the 100-foot station. The last shipment made from this property gave a return of $63 per ton in gold. A stamp mill will be put up at the mine to handle the low-grade ore, of which they have 5 feet, which averages $13 per ton. The payroll for November will be upwards of $5000.

Turret, Cal., Nov. 24th, '99.

CLEAR CREEK COUNTY.

In the Brostrom claim at Ozone, ten miles from Idaho Springs, a vein 50 feet wide has been cut. The ore is low grade. Mill runs have returned $4 per ton, besides concentrates. Mr. Brostrom has let a contract for a 25-stamp mill at the mine. The formation resembles granite, is soft when mined, but after exposure for a few days it becomes hard.

The Florence tunnel is reported in ore. The vein is not exposed on the surface, but in the tunnel is 2 feet wide and assays $75 per ton in gold. The ore is free milling. It is reported that the company will put on machinery and work this vein. P. D. Goodyear is Supt.

EAGLE COUNTY.

It is reported a pyritic smelter will be built at Red Cliff to treat low-grade sulphide ores of Battle mountain.

The Iron Mask group at Gilman is outputting 80 to 100 tons of ore per day. Ore is being hoisted from both the Iron Mask and Clinton inclines, and both sulphides and carbonates are being shipped. The former goes to Salt Lake and the latter to Pueblo. The face of the drainage tunnel is in about 200 feet. Several new bodies of sulphides and carbonate ore have been opened in the Iron Mask within the past few weeks. The company is employing sixty men.

GILPIN COUNTY.

The Flack mine, operated by lessees, has opened a 2-foot vein in the 400 level, from which shipments are being made.

F. Rickard has been appointed Mgr. O. K. mine, on German hill. The main shaft, 400 feet deep, will be retimbered. The mine has been a good producer under the leasing system for several years, and the owners will now operate it themselves.

The shaft of the Americus is down 926 feet and sinking with three shifts. A fine vein has been opened in the bottom, but not high enough to ship. The 400 level is producing a regular output of good ore.

A strike has been made in the Concrete, the smelting ore running seven ounces per ton, and the mill dirt two ounces per ton.

The tunnel on the Geiger mine of Pine Creek district has cut a 12-inch vein of smelting ore, and shipments are to be made.

The cleanup of ten stamps of the Gilpin mill on a week's run on Robert Emmet ore resulted in fifty-five ounces bullion. The last shipment of smelting ore ran $200 net per ton.

Shipments from Black Hawk for the first week in November were seventy-nine cars of smelting ore and concentrates.

The owners of the Cook mine will build a tram road from the mine to the new mill now building at Black Hawk.

The tunnel on the London group, in Pine Creek district, now in 400 feet, has cut a rich streak of tellurium. The streak is from ¼-inch to 3 inches wide.

The Ivanhoe mine, on Quartz hill, is working ten men and producing a fair grade of ore

from the 800 level, says the Denver *Republican*. The smelting ore runs $40 to $50 per ton and seventy-five tons of mill dirt shipped last month gave good returns.

JEFFERSON COUNTY.

A vein of gold rock has been found on the farm of J. Snyder, six miles from Evergreen. It is said it will average $50 per ton.

LAKE COUNTY.

The Boston Gold-Copper Smelter, capacity 300 tons a day, is the fourth smelter now operating at Leadville.

The Rock Hill Con. is down 600 feet and driving to the Iron fault. The lime shows evidences of heavy mineralization. The Revenue has a heavy flow of water in the wash and is cutting a station for an 18x8x18 station pump. A company is also being organized in the East to develop the Robinson placer, which will sink a shaft in Georgia gulch.

The O'Brien & Barker lease on the Fortuna tunnel has made several shipments of first-class ore carrying an ounce and a half in gold, with some silver and a good percentage of lead.

The Sedalia mine, on Little Ellen hill, is working from the 700 level, which has recently produced 300 tons of good gold ore carrying a good percentage of lead. The ore in the bottom of the shaft runs $50 gold and 20% lead.

S. Morley, Baer Bros. and J. M. Wormell are pushing development on the Venus, on Sugar Loaf mountain, on the opposite side of the Arkansas valley from Leadville. The Tiger, an adjoining property, has produced $500,000.

The water is being lowered in the Humboldt mine by joint arrangements with the Adelaide people. When the copper stopes are uncovered and the workings in shape, the Humboldt will begin shipping copper ore and the Adelaide will produce iron sulphides, high grade in silver.

OURAY COUNTY.

A new lead has been opened in the second level of the Newsboy by the leasers, which shows gray copper and yellow copper-silver ore.

The Wedge mine is again in good ore and working a large force steadily. The owners will build a new mill in the spring.

H. F. Brown, formerly of the American Nettie, is driving a tunnel 1000 feet long to cut the main body of ore at 1200 feet in depth. The property is owned by a syndicate in Toronto, Canada.

In October 225 cars of ore were shipped from Ouray station.

SAN JUAN COUNTY.

The Ridgeway, near Silverton, recently shipped a carload of ore to Durango which returned $800 per ton. Two more carloads of the same ore were packed down the mountain and since shipped. The claim is being worked under a lease.

SUMMIT COUNTY.

The new 20-stamp mill at the Cashier mine is completed. A small dynamo for lighting is being installed. A separate engine will be used to drive the dynamo and concentrators. The mine will be worked through a tunnel 500 feet to the mill. The track, which is laid with twelve-pound rails, is covered from the tunnel to the mill to avoid delay from snow. Large quantities of gold-bearing ore are blocked out in the mine.

In the placer mines the preparatory work for the season of 1900 is going on. Several new dredging plants and a number of steam excavating plants are contemplated.

Blanks, Jonson & Heter, operating the Helena and Bellevue, are keeping the Gold Pan mill running day shift on second grade ore from the dump of the Helena. The first grade runs well in lead, does not require concentrating, and is of a good smelting grade. There are two streaks of good grade galena ore, besides a large body of concentrating ore, opened in the shaft of the Helena.

The Banner G. M. Co. have commenced sinking a 200-foot shaft on the Fountain Valley claim. A contact vein carrying good values has been discovered and will be developed.

TELLER COUNTY.

(Special Correspodence). — The Mary McKinney, at Anaconda, is shipping forty tons per day. The mill ore runs from $25 to $40 per ton, the smelting ore running from $80 to $140. The shipments at present are from the 300 level, which is opened 1600 feet along the strike of the veins. Recent work has opened the same ore body at the 400 level. The two parallel veins on the property are about 40 feet apart at the surface, but it is believed they come together at about 400 feet depth. Some water is encountered, and the pumps lift 800 gallons per minute.

C. A. Phillips, Supt. Dead Pine mine, on Battle mountain, states that the property is shipping 200 tons per month. There are two shafts, 1600 feet apart, the first being at a depth of 835 feet and the second about 400 feet. A force of 40 men are employed, the major portion of the work being development. Air drills are to be put at work in the ore body. Heretofore the three air drills were employed in prospecting work. The property belongs to the Ophir M. & M. Co.

The Ajax is shipping twenty tons per day from the 600-foot shaft, as greater depth is being gained. Besides the ordinary character of the sylvanite, this property has produced some rare streaks of calaverite. A new and much larger plant of machinery has been ordered, which it is intended will be put in place next spring.

At the Granite mine the new 300 H. P. electric motor is being installed. Other surface improvements are being made.

The Lillie, same locality, produces 1000 tons per month, the average value of which runs $55 per ton. The shaft is now 800 feet deep.

The Dillon, in charge of Supt. J. P. Horgan, is shipping about 500 tons per month. The shaft is being sunk from 480 to 600 feet. This is one of the new properties on Battle mountain and is well equippped with steam hoist and air compressor. M. Finnerty, of Denver, is heavily interested.

The Doctor, on Raven hill, is being operated under lease by the Doctor & Chief M. & L. Co., with J. Winchester as superintendent. The shaft is 800 feet deep; some shipments are being made, though at present the principal work is for development purposes.

The Orpha May, in charge of Supt. J. Starkweather, ships about 500 tons per month. The main shaft is 900 feet deep, over which is heavy hoisting machinery. The group comprises thirty-eight acres on Bull hill, on which there are four other shafts. In the main workings there are thirteen levels, ore shipments being made from all of them.

The Vindicator, near Independence, is shipping about 3000 tons per month. The buildings and hoisting facilities here are on a large scale.

The Jerry Johnson, one of the new properties on the eastern slope of Bull hill, is under lease and ships about twenty-five tons per day from a 130-foot shaft. The grounds extend 1400 feet on the trend of the vein and end-lines with the Damon on the west. The ore body opened is said to be 40 feet wide in places, the ores running $50 to $80 per ton. An important suit is pending between the Damon and Jerry Johnson ownerships, involving the rights of the former under the apex theory.

The Gold Coin is producing about 100 tons per day, the Wild Horse 35 tons and the Jack Pot 50 tons, all being under the Woods management. The last-named is operated under lease, which expires on April 9, 1900. The Economic Gold Extraction Co.'s reduction works has begun operating. When fully complete its capacity will reach 350 tons per day. The mines controlled by the Woods Investment Co. are expected to supply as much ore as the plant can handle.

The Oneida mill is operating, using the Murphy process of reduction, consisting, in part, of very fine pulverization, roasting and amalgamation.

The November output of the district reaches, in round numbers, 40,000 tons of ore, but it is asserted by ore buyers that the average tonnage value is hardly up to that of the October output.

Substantial progress is being made, looking to a considerable increase of the milling facilities for the district.

Keen activity in the Cripple Creek mining stock market from one to two months ago resulted in the tieing up of no small amount of money in those channels, and the general slump of prices which has prevailed for the past ten days has created a noticeable stringency in money matters, felt mostly by tradesmen. The stocks of well-known mines and those of prospects which can make a substantial showing will, it is generally believed, gradually resume former prices. WASCOTT.

Cripple Creek, Nov. 25, 1899.

Some time since an ordinance was passed by the City Council of Cripple Creek giving the right to mine under the city to the Kansas City & Cripple Creek G. M. Co. The lease having lapsed by default, a new ordinance was recently introduced giving the same right to M. S. Beale. It gives to the city a joint interest in the direction of the lease, provides that certain royalties shall be paid to the city; also, that the mining under the city shall be under the direction of the City Council, which shall provide that no stoping shall be done near enough to the surface to affect the security of the residents; that no ore or waste shall be dumped upon any of the streets and alleys; that no outlets shall be made that might prove dangerous to the city. No action has yet been taken.

The Victor mine is again reported in pay ore, for the first time since December, '98, when it was officially reported that the Victor vein had pinched. The ore body has been found on the 1000-foot level 100 feet from the shaft. Its extent has not been determined. The ore assays from $60 to $300 per ton. Moffat & Smith, the largest stockholders in the mine, have for some time been advancing $10,000 per month for exploration work and the mine now has a debt of $70,000. The Victor adjoins the Isabella mine, which recently shipped fifty tons of ore to the smelter which netted $165,000.

A rich strike is reported on the Chicken Hawk on Guyot hill, adjoining the Republic of the Mary McKinney Co., and it is thought that the ore found is a continuation of the latter. The find was made at a depth of 500 feet. There is 4 feet of ore in the breast which assays four ounces to the ton.

W. S. Stratton, before going to Europe, bought the Longfellow group on Bull hill. A force is at work sinking a new working shaft, which is to be put down 1000 feet.

IDAHO.

The Peacock mine in Seven Devils district is reported bonded to the Boston Copper Co.

John Merrill of Placerville says that $110,000 has been paid on the Granite and Fall creek placer ground by an Eastern dredging company, and that the next payment will be $115,000.

LEMHI COUNTY.

The machinery for the hoist of the Dr. Franklin Co. has been taken to the Brown Bear mine in Blackfoot district. The hoist will be ready and sinking commenced in the 500-foot shaft by January 1st. It is reported that the company have options on another group in Blackbird district.

At the Midland Belle mine, eight miles north of Salmon City, an incline shaft was sunk on the vein 90 feet deep, on a pay streak 1 foot wide of soft, brown oxide of iron, worth $50 per ton, free gold. At the bottom of the incline the pay streak is 18 inches and assays $200 in gold.

SHOSHONE COUNTY.

The Sixteen to One M. Co. has the stationary cables for its tramway in place and the running cable ready to place in position. The mill is not ready for work, but it will be early in December.

MONTANA.

MADISON COUNTY.

The Maggie A. Gibson dredger, near Virginia City, has closed down for the season, which was not satisfactory financially.

SILVER BOW COUNTY.

Butte will produce more copper this year than ever before in its history. All of the important mines in the Anaconda group are being equipped with new hoisting works and steel head frames. Extensive improvements are also being made on some of the Heinze properties. It is reported that the Anaconda Co. will show net earnings of $9,000,000 for the year. The company are paying out $330,000 monthly in wages.

NEVADA.

CHURCHILL COUNTY.

The property of the National Nickel Co. will be sold on the 9th to satisfy a judgment obtained by the Nevada Nickel Syndicate against the former company in the U. S. Circuit Court.

STOREY COUNTY.

The Truckee River General Electric Co. has awarded a contract to the Westinghouse Electric & Mfg. Co. for the construction of two generators of 1000 H. P. each for the power house at Floriston, on the Truckee river. Each generator will weigh 90,000 pounds. The plant will be in duplicate, so that in case of accident to one of the parts the duplicate can be used until the other is repaired.

The first elevator placed in the C. & C. shaft worked satisfactorily for a time, but never as well as No. 2. The first is now to be removed and a duplicate of the second elevator put in its place, when better results are hoped for. The latest official telegram is as follows:

VIRGINIA, Nev., Nov. 29, 1899.

To Aug. Waterman, Secretary Comstock Pumping Association, San Francisco: At 6:30 this morning the water was 102 feet and 10 inches below the 1950-foot level station. No. 1 elevator has been running continuously. JOS. R. RYAN.

Comstock miners who went to Costa Rica are returning. They have had enough of it.

WHITE PINE COUNTY.

The Chainman cleanup was finished last week and another lot of gold dust and bullion is on its way to the refinery, says the White Pine *News*. J. P. McOmie, one of the owners and superintendent of the plant, says that, considering the number of obstacles met and overcome in treating the ore, the results are satisfactory. In the early part of the run the extraction was poor, but it was improved until the last five tanks showed an extraction of from 76% to 83% of the gold values in the ore, and this, it is expected, can be improved upon. A force of mechanics are fitting the mill with steam pipes for heating purposes and getting ready for winter. The reserves in the mine already blocked out and of a milling grade are sufficient to keep the plant in operation at its present capacity for several years, and there is still a large territory above water level yet to be explored. The refractory character of the ore has handicapped the property in the past.

NEW MEXICO.

In the Cerrillos mining district silver-lead ores, suitable for fluxing, are locally reported to exist in great quantity. The zinc found in the lead below the water level has heretofore been the chief deterrent in development.

BERNALILLO COUNTY.

A strike of engineers and mechanics at the Albemarle mine, Bland, has locked out 250 men. Fifteen strikers demanded higher wages, which the management refused. The strikers were paid off and both the mine and the mill were closed down. Boston capitalists own the mine. The high price of wood and the impossibility of getting coal at present will prevent the resumption of work until the electric power-house at Madrid is finished.

EDDY COUNTY.

The Galistee M. Co., in which Thomas A. Edison and New York capitalists are interested, and which bonded the Ortiz grant from Missouri capitalists to test Edison's process for extracting gold from placer ground and ore, has filed incorporation papers at Santa Fe.

GRANT COUNTY.

Important copper discoveries are reported from the Santa Rita mountains, and a large number of prospectors are stampeding to the place. A. B. Sanford says that the ore does not occur in fissure veins, but is found in deposits of greater or less extent, all of which are highly mineralized, native copper being frequently found, sometimes in large masses and sometimes disseminated through the rock in fine particles. It is said that not a hole has been sunk to a reasonable depth without finding ore.

SANTA FE COUNTY.

J. P. Victory has made arrangements by which the turquoise trust acquires 90% of the turquoise properties in New Mexico, which at present supplies the bulk of turquoise to the world. The trust is incorporated under the name of the North American Turquoise Syndicate, capitalized at $1,000,000.

OREGON.

BAKER COUNTY.

W. L. Vinson is going to put a $50,000 dredger on his placer ground on Powder river, near Sumpter.

J. H. Stoddard of Sumpter, it is stated, panned $60 in coarse gold from 100 square feet of ground in a pit 10 feet deep, within the limits of the town of Sumpter. The same formation is found along either bank of Powder river, running through town, and owners of adjoining placer claims are preparing to commence operations. W. L. Vinson, who controls two miles of ground along the river channel, has ordered a dredger to work the deposit. It is estimated the ground will average 30 cents per cubic yard. The dredger will be in operation by April 1, 1900

JACKSON COUNTY.

Dr. E. O. Smith, who has bonded the Haggin mine at Tolo for $25,000, proposes to sink a 1000-foot shaft.

JOSEPHINE COUNTY.

The first gold dredger in southern Oregon is being operated by the English-Canadian Co., at Faun's mine, on the Illinois river, near Waldo.

UTAH.

JUAB COUNTY.

A report from Centennial-Eureka states that the ore body on the 700 level was explored for 11 feet and assays show $70 per ton. Upon the dip the vein shows stoping ground 600 feet, the ore chute being 80 feet in width and 60 feet high. The general average of its body shows $30 gold, 25 ounces silver and 3% copper. The strike in the surface tunnel shows 20 feet of ore in a chute independent of any hitherto explored. The first assays showed $44 gold, 35 ounces silver and 1% copper; later assays gave $144 per ton gold and 139 ounces silver.

In the Tesora, at Tintic, a 22-inch streak of high-grade ore has been struck, lying on the foot wall. By the side of it, in the same vein, which is 6 feet between walls, are 4 feet of second-class ore. The high-grade copper-bearing vein has been traced from the Alaska to the Tesora, nearly two miles.

SALT LAKE COUNTY.

Tribune: The Horace Greeley and Gem mines, at Bingham, have been bonded by Salt Lake and Bingham people. The Horace Greeley has long been a producer and the Gem has some good copper-bearing ore. The claims adjoin each other on Muddy gulch, a tributary of Carr Fork, with the properties of the United States M. Co. on one side and the Last Chance group on the other. The ground is traversed by two veins that have been opened in the Greeley, by a crosscut tunnel that intersects each at a depth of 150 feet. From these workings ore worth $160,000 has been marketed. Recently the ground has been worked on a lease, the shipments, 263 tons, netting $41 per ton. The ores show an average of 32% lead, 26 ounces silver and $15 gold per ton. —The management of the West Mountain placer, Bingham canyon, has contracted with the Jordan Narrows people for power and placed an order with the Westinghouse people of Pittsburg, Pa., for two electric hoists. These are to be installed at the two new inclines by which the gold-bearing channel is to be opened to bedrock, the inclines to go down from the rim at an angle of 25° to reach the bedrock at 250 feet. The inclines will be run 600 feet apart along the bar; the gravel will be raised and dumped into the sluice boxes. The two hoists will be followed by others.

SUMMIT COUNTY.

Most of the miners stoping in the Ontario at Park City have been laid off until an adjustment of differences between the management of the mine and the smelter upon sampling was had. About 1000 tons of Ontario ore are tied up in the smelter yards, the smelter management declining to allow it in the furnaces until a resampling has been had and alleged inaccuracies in the sampling of Park City ores traced to their proper source.

The New Anchor mill is putting through 100 tons of ore daily.

E. Williamson has two shifts operating at the Boulder Basin property, on the copper belt south of the Anchor.

The following shipments of ore were made the past week from Park City:

	Tons.
Silver King	600
Daly-West	316
Anchor concentrates	140
Apex	35
Valeo	25
Total	1,116

At the Daly-West carpenters are building a 40-foot addition to the north end of the mill to make room for Wilfley tables. This will make ten Wilfleys, and hereafter five tables will be run on slimes instead of two, as at present. From 120 to 150 tons of ore are being run through the mill daily, and four men separate first-class from second-class ore for the sampler.

TOOELE COUNTY.

Capt. J. R. DeLamar has introduced the caving system of mining in his Mercur mines. This is a system largely practised in the Lake Superior iron mining regions, by means of which large ore bodies may be cheaply and expeditiously removed without the employment of timber. It can not be successfully applied under all conditions, but is peculiarly suited to the Mercur mines.

WASHINGTON.

FERRY COUNTY.

Development of the Insurgent mine in Republic camp is to be resumed in December. The first assessment on the capital stock has been levied. It is stated that the new work will be in the nature of deep development. The earlier work on the property has shown high values near the surface. The company will now go down on the vein to determine the value of the mine. The Insurgent has the Lone Pine cross leads. It has been idle two months.

Work is to be resumed on the Alabama at Republic. The property is east of the Tom Thumb in the north end of the camp. The company proposes to extend the crosscut tunnel 50 feet, within which distance it is expected to encounter the vein at a depth of 125 feet.

Spokesman-Review: The Tom Thumb mine at Republic is to be equipped with machinery. At the 150 level telluride ores have been found. In the north drift the ore assays $106, while in the south drift $262 has been obtained. The general averages from this

level have exceeded averages on the 100 level by over 50%.

WHITMAN COUNTY.

The Mother Lode, in Mascot Camp, thirty-seven miles from Palouse City, is free gold quartz. The owners are J. and C. Taylor of Farmington. Gold is distributed through the quartz, discernible to the eye. The ledge is a mixture of white and blue quartz, heavily oxidized and carrying iron rich in gold, which, when crushed, is found to contain free gold imbedded in the iron.

The Hoodoo placers, that have yielded $2,000,000, are just below the Mother Lode mine. The same quality of iron is found in the placers.

Five years ago Chinamen took out $1700 in gold from a boulder of quartz weighing a ton that had slid down the mountain side. The Taylor Bros. instituted search and discovered the lode three years ago. The surrounding ground has been located by people let into the secret by the brothers. The ledge is extensive.

WYOMING.

The State of Wyoming Syndicate, Limited, has been incorporated in London, for the purpose of acquiring and working any petroleum or oil-bearing lands, soda deposits and coal, iron or copper mines in Wyoming.

CARBON COUNTY.

A corporation known as the Boston-Wyoming Smelter, Power & Light Co. has been organized to build a copper smelter at Grand Encampment.

It is estimated the Ferris-Haggerty mines will output 100 tons of copper ore daily during the winter.

The drift in the Eureka has cut into a large body of quartz containing copper ore. The new ore body is not rich enough to ship, but will furnish concentrating ore.

CROOK COUNTY.

A short distance northeast of the central peak of Warren's Peaks is an irregular ledge traversing trachyte. It consists mainly of feldspathic rock, coarsely crystallized, with the crystals imbedded in a fine-grained feldspathic ground mass. The ledge has a reddish-brown color and in portions of it are considerable quantities of black limonite and black manganese oxide. The rock contains gold and the gulches tributary to the lode are also gold bearing. Gold and silver ores are also found at Inyan Kara and Sundance Buttes, south of Warren's Peaks.

FOREIGN.

BRITISH COLUMBIA.

At a recent joint meeting between representatives of the Mine Managers' Association and the Miners' Union an order was given to the union to furnish the Payne mine with a full force of men. This is the initial step to resume operations by all mines in the Silver-Lead Mines Association district, and means an end to the lockout existing in the Slocan for the past four months. The regular union scale of wages is to be paid, $3 50 for eight-hour shifts.

The following are the results of the Hall Mines Company's operations during October: Copper smelting—13 days 19 hours; 2,919 tons of Silver King ore from the company's mine and 189 tons of purchased ore were smelted, containing (approximately): Silver King ore, 64 tons copper, 33,930 ounces silver; purchased ore, etc, 12 tons copper, 10,380 ounces silver, 332 ounces gold. Lead smelting—20 days 22 hours; 457 tons of purchased lead ore were smelted, together with 192 tons of Silver King ore from the company's mine, from which were produced 149 tons of bullion, containing (approximately): From Silver King ore, 2,260 ounces silver; from purchased ore, etc, 145 tons lead, 15,770 ounces silver, 682 ounces gold.

On the Second Relief mine, near Erie, a large body of pay ore has been opened; the force has been increased and work will be prosecuted throughout the winter. The lead is 6 feet in width, with good values.

Kootenaian: It is reported that the Lake Shore group of mines at Moyie, in East Kootenay, owned by the Canadian Gold Fields, Ltd., and the Moyie and Queen of the Hills claims, adjoining the Lake Shore group, have been consolidated. The deal also includes the St. Eugene group at Moyie. The new company will be known as the St. Eugene Con., and will be capitalized at $3,500,000. The properties are all silver-lead producers, and the Lake Shore and St. Eugene mines are shippers. Together they will make the biggest silver-lead mining company in British Columbia.

SOUTH AFRICA.

The Transvaal gold supply may be tabulated as follows:

	Tons milled.	Ounces gold secured.	Value.
1887	.....	23,125	
1888	.....	208,121	
1889	.....	389,557	£2,250,000
Unrecorded	.....	42,000	
1890	.....	494,817	.....
1891	.....	719,268	2,560,000
1892	.....	1,210,869	4,297,610
1893	1,217,792	1,478,477	5,187,206
1894	2,674,673	2,024,164	6,963,100
1895	3,456,575	2,277,640	7,840,779
1896	4,011,697	2,280,892	7,864,341
1897	5,325,355	3,034,678	10,683,606
1898	7,331,446	4,295,609	15,141,376
Aggregate		18,469,219	
1899 (9 months)		3,913,810	£13,700,000
Totals		22,383,029	£76,488,018

Dividends paid by the Rand mining companies in recent years, according to the figures furnished by the Chamberlain mines, are as follows:

1892	£ 811,864	1896	£1,638,881
1893	1,100,203	1897	2,707,180
1894	1,540,394	1898	4,847,505
1895	2,198,943		

The existing conditions in South Africa make mining news difficult to obtain. Most of the mines of the Witwatersrand are closed and none are operating with full and competent force.

MEXICO.

It is reported that G. A. Treadwell has sold the Copito mines in Sonora, east of Magdalena, to New York capitalists for $3,500,000. The ore is rich in copper and gold.

In the placers near El Cozon mountains, Sonora, Jose Montijo recently picked up an $800 nugget.

It is reported that near the head of the divide in the mountains east of Hermosillo excellent gold prospects exist, which have only superficial development or none at all.

Personal.

J. P. EVANS of Denver, Colo., is in Kingman, Arizona.

BERNARD MACDONALD is at present sojourning at Rossland, B. C.

COL. G. H. MENDELL is giving expert testimony in Portland, Or.

H. S. SHERARD is inspecting mining property at Ainsworth, B. C.

MARSDEN MANSON of San Francisco will return from Virginia Jan. 1, 1900.

J. W. MACKAY, of Comstock bonanza fame, is to be a Southern Pacific director.

A. L. MOORE is the new Supt. of the Green mine, near Sugar Pine, Tuolumne Co., Cal.

C. DICK of San Francisco claims to be the only Chinese traveling salesman on the road.

CHAS. GRACEY succeeds E. G. Eckis as Supt. Southwestern M. Co., El Dorado canyon, Nev.

E. H. NOYES of Boston is visiting the property of the Little Tiger M. Co. of Yreka, Cal.

M. S. AQUIRRE, of Nogales, has been appointed manager of the Cobre Grande Copper Co.

DR C. J. TEASS succeeds Dr. Drake at the Mountain Copper Co.'s hospital at Keswick, Cal.

W. C. RALSTON leaves San Francisco, Cal., for Boston on the 5th inst., to be absent five weeks.

S. W. TRAYLOR, of the Colorado Iron Works Co., has returned from Globe, Arizona, to Denver, Colo.

BENEDICT CROWELL of Cleveland, O., is in Salt Lake City, Utah, examining mining properties near that city.

W. J. BROWNING AND F. WILDING of Chihuahua, Mexico, are examining the Strode mine, Trinity Center, Cal.

W. A. CARLYLE left Rossland, B. C., on the 17th ult. to assume the general management of the Rio Tinto mine, Spain.

VICTOR M. CLEMENT has returned to Salt Lake, Utah, from an inspection of mining property near Marysvale, in Beaver county.

THE State of Idaho will issue a reward of $1000 for the apprehension of Ed Boyle, one of the leaders of the dynamiters in the Cœur d'Alenes.

G. E. TOMLINSON AND E. C. WEBSTER of Pasadena, Cal., have recently returned from Chloride, Ariz., where they went to examine some mining properties.

HENRY CALLAGHAN, a California miner now in charge of the Lakeview Con. mines, Western Australia, is in San Francisco, and returns, via London, on the 5th.

J. RANDAL has returned to San Francisco from Sonora, Mexico. He says the war between the Mexican Government and the Yaquis will last for two years. He thinks that the desire of the Mexicans for the Yaqui lands is the principal cause of the war.

E. S. YOUNG of Vladivostock, Siberia, says there is a vast and increasing market in Siberia for American flour, agricultural and mechanical implements and other manufactured products, and predicts a permanent volume of trade between this country and the territory Russia is now developing.

CAPT. WM. ABERCROMBIE, who has spent six years in Alaskan exploration, and who has just surveyed an all-American route to the Klondike, has gone to Washington to make his report to the Secretary of War. He says that the main feature of the expedition is the completion of plans for the opening of the Klondike region for the American miner so he can land at Valdez with his pack pony and prospect any part of the public domain without interference from the officials of a foreign country.

T. C. DUNN of New York, Pres. Munina-Alaska G. M. Co., has returned from Cook Inlet. He considers the outlook for development in the Cook Inlet country and on the Kenai peninsula good. His headquarters are at Homer. This is also headquarters for the Cook Inlet Coal Fields Co. They have built a dock there and are building six miles of track extending back from the beach. Mr. Dunn's company has been prospecting. The ore is low grade, but there is plenty of it, both in quartz and slate, and he talks of a mill in 1900.

D. B. MAY, Commissioner General Land Office in Alaska, is here from Sitka en route to Washington, D. C., and says that Alaska's present mining laws permit a few men to monopolize the country; that powers of attorney are being abused and should be stopped; that 6000 claims have been located by about 200 miners. He thinks that Congress should regulate the size of placer claims. At present a man can take up a strip 1320 feet by 660 feet, or about twenty acres. Commissioner Day thinks that these twenty acres could be divided among several with plenty of pay for all, and that the amount now allowed for placer claims should be cut down to 500 feet. Who can tell what a Day may bring forth!

Industrial Notes.

—Denver, Colo., is to have a Pullman car repair shop.

—The Great Northern Express Co. will open an office in San Francisco.

—Wyoming convicts are breaking up seven miles of condemned U. P. cars at Laramie.

—Telephonic communication begins this week between Truckee and Grass Valley, Cal.

—The Pacific & Idaho Northern Railway Co. has 400 men grading in Weiser canyon, Idaho.

—Everett, Wash., is to put in a $55,000 sewer system, including 9¾ miles vitrified clay pipe.

—The $35,100 Plumas county, Cal., 4% 35-year refunding bonds were sold to S. Holmes at 101.196.

—Paper money has fallen to one-fifth its normal in value in Colombia, S. A., because of the decline in coffee.

—Demand for quartz miners in Colorado has so drawn upon the coal miners as to threaten a coal famine in that State.

—The Colorado Springs, Colo., Mining Stock Association contemplates the erection of a new mining stock exchange.

—Rydstrom & Goerig have a contract to build an electric railway between Seattle and Tacoma, Wash., for $600,000.

—The arbitration commission at Vancouver, B. C., shows evidence of desire to exclude Chinese miners from Canadian mines.

—The Southern and Central Pacific Companies are credited with the intention to spend $6,000,000 in improvements in 1900.

—The California wide-tire law goes into effect January 1, 1900, but will apparently be as much of a dead letter statute as the newspaper signature law.

—By Dec. 31, 1900, there will be an all-Canadian telegraph line between Vancouver and Dawson. There is already a telegraph service as far north as Quesnelle, B. C.

—A steamship in the Alaskan trade is about as good paying property as any at present. The Roanoke is credited with receiving $80,000 passenger money in one round trip.

—Eastern street railway companies are importing steel rails from Scotland and Germany. The Federal Steel Co. of New York is shipping steel rails to Glasgow, Scotland.

—The general organizer of the American Federation of Labor in Wisconsin estimates that the average advance in wages in Wisconsin for all classes in the year past was 15%.

—The extension of the copper vein of the United Verde mine, Arizona, has been discovered again—this time by a Kansas City mining engineer—in the grand canyon of the Colorado river.

—The McCloud River Lumber Co., Siskiyou county, Cal., is to be sold to an Eastern company for $2,500,000. A railroad is now operated twenty miles. The new company will extend the road to Fall River, sixty miles.

—The Russian government is about to establish a steamship line from Port Arthur to the United States, to be operated in connection with the Transsiberian Railroad. Either San Francisco or Seattle will be the eastern terminal.

—Within the past few years the United States, in sea-going tonnage, has dropped from the second place, next to Great Britain, to the fourth position, below Germany and France, and, if steamships in foreign trade alone are considered, below Norway and Spain, and only slightly ahead of Japan.

—The Standard Oil Co. has advanced the price of crude petroleum 2 cents in the Pennsylvania fields and 1 cent in the Lima, Ohio, fields, making the quotation for the Pennsylvania product $1.58 per barrel and for Ohio $1.07. This advance is the latest of a series, during which the Standard has increased the price nearly 40 cents a barrel. The present prices are the highest in four years.

—During October orders were given by the various railroads in the United States for the building of 33,023 new cars, of which 19,418 were box, stock, furnitnre and refrigerator cars, 10,781 were gondola and coal cars, 1700 were steel cars, 810 were flat cars and 314 were passenger and street railway cars, 100 of the latter being for export. Orders for 323 locomotives were also given, thirty-eight of these being for export.

—Engineers are designing the earthquake-proof steel palace for the Crown Prince of Japan which is to mark the advent of American steel construction in the Mikado's lands. The Imperial Government has appropriated $3,000,000 for its erection. Foundations are being laid with a view to rearing the framework in February. Around the skeleton, on beams and bars, will be built a house of granite and marble, expected to eclipse in beauty of design anything the Orient has ever known. The structure will spread to dimensions of 270x400 feet, raising to a height of 60 feet.

—Carlisle Mason of Butte, Mont., has a scheme to utilize the water power of the different rivers along the line of the Oregon Short Line Railroad from Salt Lake, Utah, to Pocatello, Idaho; from Pocatello to Butte; and from Pocatello west and north to Spokane, Wash., and the coast. The scopy plan embraces the erection of plower plants at all the stations, with the expectation that the Oregon Short Line and O. R. & N. will run cars by electrical power. The combined mileage of the two systems is over 2000 miles. The only steam plant that would be required, Mr. Mason figures, would be at Monida. He calculates that about 180,000 H. P. could be secured along the lines of the two railroads. He claims that he has $5,000,000 subscribed in Salt Lake. The railroad officials laugh.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 21, 1899.

637,493.—TEMPORARY BINDER—A. S. Abbott, Los Angeles, Cal

637,223.—FEED WATER HEATER—C. F. Bainter, Los Angeles, Cal.

31,881.—DESIGN—J. B. Kelly, Portland, Ogn.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

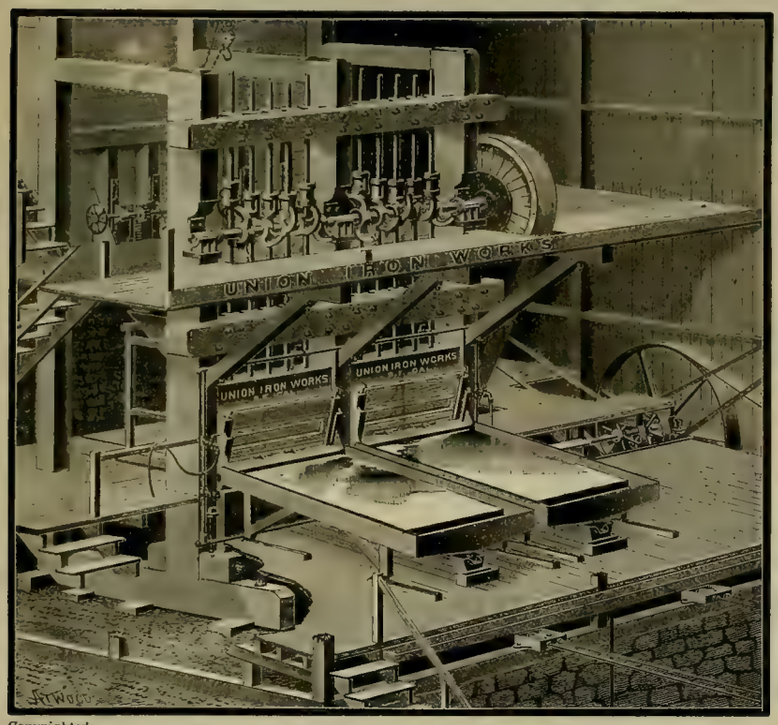
Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LOCK.—O. H. Burden and S. Lovatt, Pilot Bay, Canada. No. 637,497. Dated Nov. 21, 1899. This invention relates to improvements in locks which are applicable to doors, trunks and to any parts which it is desirable to lock and make secure. It comprises a spring-pressed slidable bolt, a fixed casing within which it is movable, a hollow cylindrical knob shank extending transversly to the bolt and turnable within a fixed exterior cylinder or casing having circumferential slots made in it so as to expose the surface of the cylindrical knob shank. The bolt has elastic arms extending rearwardly upon each side of and engaging the knob shank above and below through the slots in its casing, so that when the knob is turned in either direction it will retract the bolt. A cylinder is located interior to the knob shank and has a slot made longitudinally from end to end with inwardly projecting lugs or pins. A key has corresponding grooves or channels adapted to be introduced into the slots, and a tumbler consisting of jointed sections is pivoted within the slot in the interior cylinder and has a lug projecting outwardly, and a spring by which it is normally forced in that direction. Slots are made through the knob shank and the exterior fixed cylinder, with which slots the tumbler engage when they are coincident, and the outer ends of the tumbler are so formed as to be engaged by the key when it is introduced so that the tumbler is moved about its pivots and retracted to allow the knobs to be turned and the bolt to be withdrawn.

LUMBER DRIER—G. X. Wendling and O. W. Crawford, San Francisco, Cal. No. 637,307. Dated Nov. 21, 1899. The object of this invention is to provide a means for stacking lumber so that heat passages or flues are formed within the body of lumber thus stacked and heat may be passed directly therethrough. In conjunction with this is a truck having a swinging framework adapted to receive and hold the lumber, the framework being so journaled to the truck that it may be turned into one position for the purpose of loading, and afterwards turned to the position which the lumber is to occupy while being dried. The kiln is so constructed that after the frame is loaded and the stack of lumber completed upon it the stack is locked in place upon the frame with flues or passages formed by the piling of the lumber. The car or truck is then run into the kiln and, fitting between the sides, the heat from the heat pipes or other source of heat passes up between these sides and is by them directed through the flues or passages which are formed in the lumber, so that every part of the lumber is exposed to the direct current of the heat. Suitable valves or gates are provided for the escape of the heat from the drying chamber, and these gates are so arranged that by opening certain ones the direction of the heating current will be changed and caused to pass through any part of the lumber stack.

Catalogues Received.



Catalogue No 35, issued by the M. C. Bullock Mfg. Co., 1170 W. Lake st., Chicago, Ill., is devoted to an exposition of the Champion mine ventilator, which it fully illustrates and describes. Considerable interesting data is furnished on the subject of mine ventilation, and all the requirements connected with the installation of a Champion ventilator are treated in concise tabulated form.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

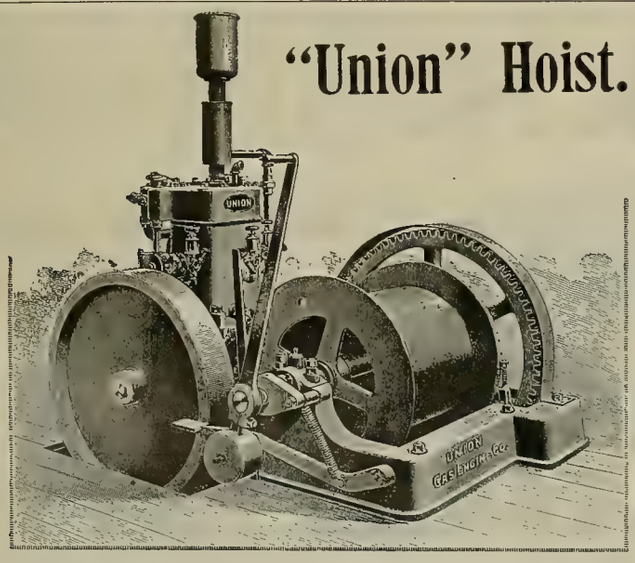
THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.



Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

MINING AND MILLING MACHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

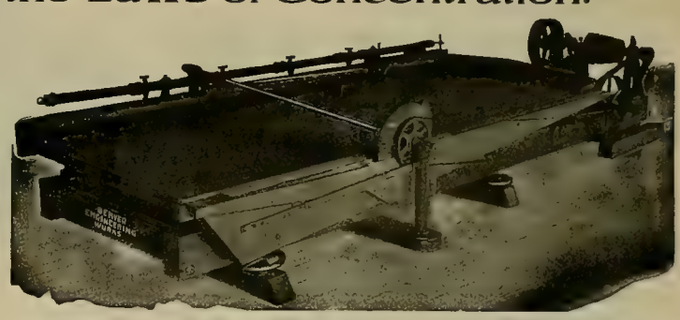
For the Treatment of

GOLD, SILVER, LEAD, COPPER and PYRITIC ORES.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.

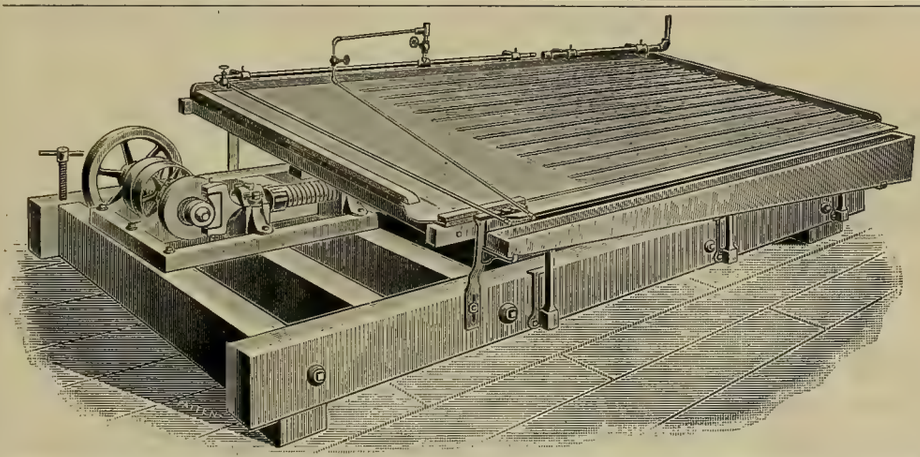


(SEE PAGE 649.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.



The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

THE BRYAN ROLLER QUARTZ MILL.

We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result—they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : :

Strong.
Economical.
Simple.

MANUFACTURED BY

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**

Market Reports.

SAN FRANCISCO, Nov. 29, 1899.

SILVER.—London, 27¾d; New York, 59¼; San Francisco, 59@59⅝; Mexican Dollars, 47¾@48⅛; New York exchange, sight, 10; telegraphic, 15 cents premium.

LEAD.—New York reports steady, $4.60 bid, $4.65 asked; brokers' price, $4.40.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake at $17 @17.25; brokers' price, $17.25. Local—Mill copper plates, 23¼c.

The price received for Lake copper for 1899 is not expected to average much above 16c per pound, notwithstanding the 18½c market ruling in June and the present 17c market. This is due to the sales made last year for delivery this year at 12½@13c. The average selling price per pound for past years will be of interest:

1898	12.10c	1890	15.75c
1897	11.25c	1885	11.12c
1896	10.88c	1880	20.12c
1895	10.75c	1875	22.50c
1894	9.56c	1870	20.62c
1893	10.75c	1865	36.25c
1892	11.50c	1860	22.50c
1891	12.60c		

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

STEEL.—11¼@20c per pound.

TIN.—Dull, $28 bid and $28.25 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER.—Local, $50; export, $45.50 @46; carload lots, special rates.

The quicksilver market remains firm without change since last week's quotations.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

ZINC.—Very weak; $4.40 bid, $4.50 asked.

A report from Joplin states that the prospects for an independent smelter are growing less. It is now stated that at least three old smelters will be started up and the need for an independent one obviated.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¾c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

NAILS.—List per keg: No. 20 to 60d, wire, $4.45; cut, $4.15; 10 to 16d, wire, $4.50; cut, $4.20; 8d, wire, $4.55; cut, $4.25; 6 and 7d, wire, $4.65; cut, $4.35; 4 and 5d, wire, $4.75; cut, $4.45; 3d, wire, $4.90; cut, $4.60; 2d, wire, $5.15; cut, $4.85. In carload lots, special rates in carload lots 10c per keg less.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ₱ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½ @6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@ 2¾c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

California Wide Tire Law.

The California law goes into effect January 1, 1900. It does not prescribe tires in terms of weight capacity, but in dimensions of skeins and axles, as follows:

SECTION 1. The width of tires for wheels upon wagons or other vehicles to be used upon public highways of the State of California shall be, for the following styles of wagons, as follows: Two and three-fourth-inch steel or thimble skein axle, 1⅞-inch tubular steel or iron axle, not less than 3-inch tire; 1¼-inch steel or iron axle, 2⅛-inch tubular or iron axle, not less than 3½-inch tire; 3-inch steel or thimble skein, 1⅝-inch steel or iron axle, 2⅜-inch tubular steel or iron axle, not less than 4-inch tire; 3¼-inch steel or thimble skein, 1¾ or 1⅞-inch steel or iron axle, 2⅝-inch tubular steel or iron axle, not less than 4½-inch tire; 3½-inch steel or thimble skein, 2-inch steel or iron axle, 2¾-inch tubular steel or iron axle, not less than 5-inch tire; 3¾-inch steel or thimble skein, 2¼-inch steel or iron axle, 3 or 3¼-inch tubular steel or iron axle, not less than 5½-inch tire; 4-inch and larger steel or thimble skein, 2½-inch and larger steel or iron axle, 3¼-inch and larger tubular steel or iron axle, not less than 6-inch tire. Other styles of axle shall have tires of same width as those of equal carrying capacity above specified. All intermediate sizes shall have tires of the same width as the next larger size above specified.

To translate these dimensions into weight capacity, has been secured the following table of equivalents from one of the best authorities in the vehicle trade on this coast:

Size.	Width of tire.	Capacity, lbs.
2¾-inch steel or thimble skein..	3 -inch	2,500
1¼-inch steel	3½-inch	2,500
2⅛-inch tubular		
3 -inch steel skein	4 -inch	3,000
1⅝-inch steel		
2⅜-inch tubular		
3¼-inch steel skein	4½-inch	4,000
1¾-inch steel		
2⅝-inch tubular		
3½-inch steel skein	5 -inch	5,000
2 -inch steel		
2¾-inch tubular		
3¾-inch steel skein	5½-inch	7,000
2¼-inch steel		
3½-inch tubular		
4 -inch and larger steel skein..	6 -inch	9,000
2½-inch steel		
3¼-inch tubular

Commercial Paragraphs.

A CONTRACT for a new 3500-ton cruiser has been awarded by the Navy Department to the Union Iron Works of San Francisco, Cal., to be constructed in accordance with the department's designs. The vessel is to be called the Tacoma, will cost $1,041,900, and is to be built in twenty-seven months. While rated as fifteen knots, Chief Constructor Hichborn says it will make seventeen knots if necessary.

WANTED.—A STAMP MILL MILLWRIGHT.
Permanent position; salary $1800 per year. Address F. T. SNYDER, The William Hamilton Mfg. Co., Nelson, B. C.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. H Secombe, in the Landecker Mine, near Placerville, El Dorado Co., to deposit tailings in a ravine tributary to Webber Creek; from Jos. J. Hoffman and T. M. Browne, in the Paragon Mine, at Bath, Placer Co., to deposit tailings in Volcano Canyon; and from G. W. Coates and E. S. Randall, in the Pebble Hill Placer Mine, near Smith's Flat, El Dorado Co., to deposit tailings in Little Chunk Canyon, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on December 4, 1899, at 1:30 P. M.

TO ASSAYERS.
A fine set of assay scales with pulp balances, all in good order, will be sold for $125.00, if applied for soon. The outfit consists of one Troemner's No. 5 balance, of latest pattern, with aluminum beam and agate bearings, original cost $175.00; also, one Becker's pulp balance, No. 18, with 8-inch beam and weights, costing $26.00. Both said balances mounted in glass case with sliding doors. Further particulars by addressing Box 4, San Andreas, Cal.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery. For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

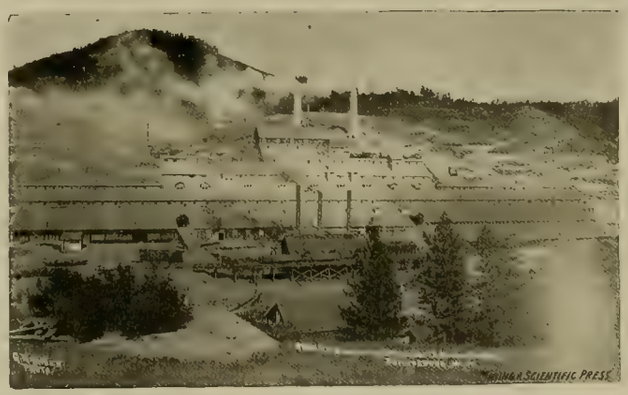
The Granite Mountain-Bimetallic Mine, Phillipsburg, Montana.

Montana has produced a number of famous bonanza mines, among them the Granite Mountain–Bimetallic, near Phillipsburg, in Granite county. It lies 2500 feet up the slope of a rugged mountain, covered with granite boulders, on the east side of Flint creek. The Granite Mountain mine is near the Summit, and the Bimetallic adjoins it on the same vein lower down the slope. The walls are hard, dark gray granite. The vein near the surface has a width of from 2 to 18 feet and is free from the walls, with a gouge of clay on both walls. In depth it develops into a great vein, ranging from 50 to 150 feet in width, with a pay streak 2 feet to over 20 feet wide. A peculiarity of this vein is that at no point along its course does the pay shoot reach nearer than 100 feet of the surface. The vein at the outcrop is recognized by iron-stained seams in the softened granite.

The Granite Mountain was the first discovered, and, like most other great mines, it has an interesting history. It was found by E. D. Holland, now of Deer Lodge, Mont, who, while hunting one day in '75, followed a deer up the mountain. The fleeing animal loosened a fragment of ore which rolled down the slope toward the hunter, who, attracted by its appearance, took it to an assayer. The latter gave Holland little satisfaction as to the value of the ore, but evinced a great interest in the locality from which it came. This the hunter kept secret until such time as he could locate the vein without being observed. He placed the names of J. W. Estell and Dr. J. M. Merrill on the location certificate, and these three, with small capital, began the development of the property. Subsequently prominent merchants of St. Louis, Mo., became interested, the discoverer (Holland) and Estell selling their two-thirds interest for $40,000. Dr. Merrill retained his interest.



Expensive development work was done, but no pay rock of consequence developed, and the company became discouraged. Capt. Plummer of St. Louis, who had charge of the property, put up a large sum to continue work when the home company refused or were unable to continue the investigation farther, and it is a matter of record that an official letter was sent him directing him to discontinue work, but had not reached him when a rich strike was made, which was so encouraging that the directors telegraphed to disregard the letter and continue the work.

The first shoot near the surface was low grade, and adits were driven in several hundred feet on a barren seam to the second shoot, from which the first 1435 tons returned about $275,000. A 20-stamp mill was built to work this ore. Then, in grading for a retort building, another vein was uncovered, which led to the richest shoot ever found in the mine.

The Bimetallic was found by sinking on the line of the fissure and crosscutting to the pay streak, and this mine, though not so valuable as the Granite Mountain, also became largely profitable.

CENTENNIAL–EUREKA MINE, TINTIC, UTAH.

THE GRANITE MOUNTAIN-BIMETALLIC MILL, MONTANA.

The Centennial-Eureka Mine, Utah.

One of the most valuable mines in Utah is the Centennial–Eureka, at Eureka, Tintic district. Recently a contract was made to furnish 100,000 tons of ore to the smelters. The property comprises twenty-seven patented mines, but the principal value is based at present on a shoot 200 feet in length and 80 feet in width. Its average value is placed at $35 per ton. It contains over $30 in gold and silver and some of the ore carries 20% copper. The mine is developed to a depth of 1200 feet.

About the year '85 W. W. Chisholm, J. F. Woodman, Jacob Bamberger and J. D. Kendall, with others, began active continuous work upon certain claims which are now included within the property of the Centennial–Eureka Mining Co. Some time after that date the property was incorporated under the above name. From time to time, as opportunity arose, additional claims were located and purchased, until at present the company owns something like 100 acres of ground.

Although some ore was found from the beginning, the property was not put upon a paying basis or a dividend declared until October, '89, and regular dividends were begun the following July, which have been paid each month most of the time since that date.

Like other mines in and around Eureka, Utah, the Centennial–Eureka is found in dolomitic limestone; the ore bodies are large and rich and give promise of great depth. The values in the ore are gold, silver and copper, with small amounts of lead.

This mine has paid $2,130,000 in dividends to its original owners, furnished one of the finest mill plants in the State and purchased several hundred thousand dollars' worth of additional territory—almost all of which has been accomplished with the proceeds of ore produced above the 400 level.

The mine is equipped with a hoist capable of going to a depth of 3000 feet with a 20-drill compressor.

Contracts have been let by the company to build an aerial tramway from the mine to the railroad, which will reduce the cost of handling ore about 70% and will transport coal from the railroad to the mine at the same time.

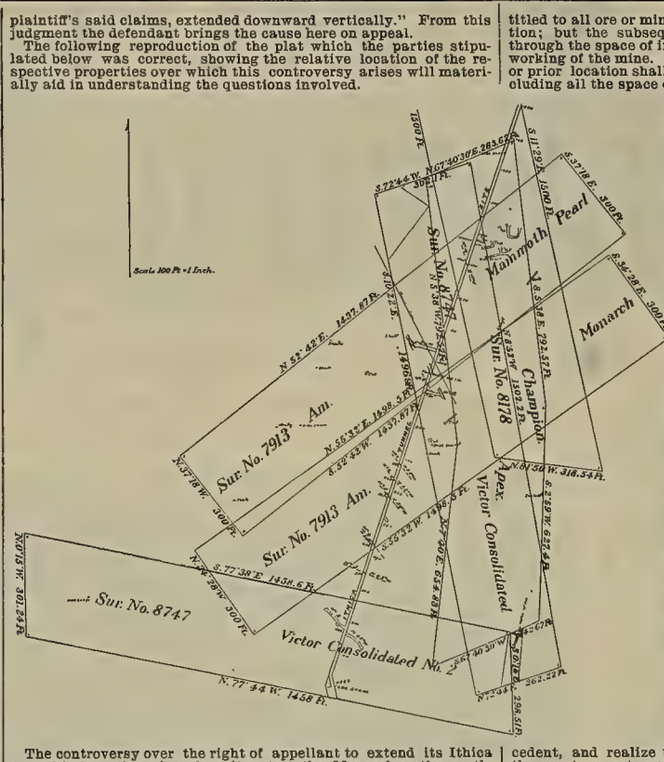
An Important Tunnel Decision.

Based on a former Colorado decision, it has been the law in that State that locators and developers of tunnel sites and tunnels had a legal right to ore veins and ore bodies cut as the tunnel work progressed, and that such tunnel workers had similar right to take out such ore throughout the full width claimed on the length of the tunnel location.

On the 21st ult. the Supreme Court of Colorado upset all this by a decision to the effect that where a tunnel site crossed prior locations the owners of such prior locations are entitled to all mineral within the limits of the lines of such prior locations, and which may be developed or discovered by the prosecution of such tunnel work. The Colorado cross-lode cases are reversed by the decision—this matter being discussed and illustrated in "Lindley on Mines," Secs. 557-560. It will be observed that the Colorado Supreme Court stands by and upholds what Justice Field of the U. S. Supreme Court once aptly termed "the iron-clad potency" of a federal mining patent. It announces that a U. S. patent can not be attacked except by direct legal action in the name of the United States.

So far as California, Montana and Arizona are concerned, this latest decision puts Colorado in line with court ruling and general practice. But it may occasion considerable litigation in Colorado, as it goes directly against former Colorado ruling on that subject.



It is a question of great interest—to Colorado miners. Nine-tenths of the inquiries received at this office from Colorado on points of mining law and custom are on this very question of tunnels and tunnel sites.

Following our usual habit, the full text of the Colorado Supreme Court decision is herewith published. Our Colorado readers especially would do well to preserve this decision. Questions as to what it was and what it did, will be asked for the next five years, and can best be answered by reference to the official text as follows:

The case was the Calhoun Gold Mining Company, appellant, vs the Ajax Gold Mining Company, appellee, No. 3954, on appeal from the District Court of El Paso County. Justice Gabbert delivered the opinion of the court.

Appellee, the owner of the Monarch, Mammoth Pearl, Ajax and Champion lode mining claims, commenced this action in the court below to recover damages and restrain appellant, as defendant, from removing ore claimed to be within the boundaries of these claims, and to which it asserted it was entitled by virtue of such ownership, and also to restrain defendant from prosecuting work upon a tunnel which the latter was excavating underneath such claims. Defendant answered, justifying its removal of ore and excavation of the tunnel upon two grounds: (1) That it was the owner of the Victor Consolidated claim, the vein of which crossed each of those embraced within the claims of plaintiff. (2) That it was the owner of the Ithica tunnel site, projected across these claims, by virtue of which it was entitled to extend a tunnel underneath them. That in prosecuting work thereon, it had penetrated the claims of plaintiff, and discovered, located and claimed numerous blind veins underneath the surface of such claims; that it had also cut the vein of its Victor Consolidated claim in this tunnel underneath the surface of plaintiff's claims and removed ore therefrom of the value of four hundred dollars, and that it claimed to be entitled to excavate and run this tunnel for the purpose of discovering such blind veins, to work and remove ore therefrom and from its Victor Consolidated vein. By stipulation, the Champion was dropped from the case. Upon the issues made by the pleadings, the facts thereby admitted, a stipulation as to those controverted and certain documentary evidence, the cause was tried to the court, which resulted in a judgment, adjudging plaintiff to be the owner in fee of each of its lode claims in controversy in their entirety as patented, and, inter alia, with respect to veins, "together with all veins, lodes or ledges having their tops or apexes therein, and including all that portion of the said Victor Consolidated vein within the side and end lines of the plaintiff's said claims, extended downwards vertically," for damages in the sum of four hundred dollars, and also enjoining defendant from prosecuting work upon or extending its tunnel underneath the claims of plaintiff, and, with respect to removing ore, enjoined defendant (employing the language of the judgment) "from further taking out, extracting or removing ore by means of said tunnel, or otherwise, from within the side lines of plaintiff's said claims, extended downward vertically." From this judgment the defendant brings the cause here on appeal.

The following reproduction of the plat which the parties stipulated below was correct, showing the relative location of the respective properties over which this controversy arises will materially aid in understanding the questions involved.

The controversy over the right of appellant to extend its Ithica tunnel is from the point where it enters the Monarch on the southerly side, and from thence across the claims of plaintiff. The blind leads discovered are in that portion of the tunnel between the point where it enters plaintiff's claims on the south and the breast of its excavation. The vein of the Victor Consolidated is also cut in this tunnel at point marked 961. The conflict in the lode claims of the respective parties is included in the territory bounded by the south side line of the Monarch, the north side line of the Mammoth Pearl and the side lines of the Victor Consolidated between these two lines. We are relieved from stating the pleadings to any considerable extent, or determining the questions of law thereby presented, because on the trial below it was stipulated that the following are involved:

"First. Whether or not the Ithica tunnel, in such pleadings described, is entitled to a right of way through plaintiff's lode claims.

"Second. Whether or not defendant has acquired, by virtue of said tunnel and tunnel site location, the ownership and right to the possession of the blind veins cut therein, to wit, veins or lodes not appearing on the surface, and not known to exist prior to the date of the location of said tunnel site

"Third. Whether or not defendant is the owner and entitled to the ore contained in the vein of its Victor Consolidatad claim, within the surface boundaries and across plaintiff's lode claims.

"Fourth. Whether or not the defendant may in this cause introduce evidence for the purpose of showing that there was no discovery of mineral in place on the Monarch and Mammoth Pearl claims of plaintiff prior to the location of said tunnel site."

From the pleadings, evidence and stipulation of the parties, the facts established, so far as material to the controversed questions of law involved, are that each of appellee's claims was located prior to either the lode claim or tunnel site of appellant; that the receiver's receipt on each of the claims of appellee issued prior to the location of the tunnel site, and prior to the issuance of receiver's receipt on the Victor Consolidated; that the patents upon the lode claims of appellee issued prior to the patent on the lode claim of appellant; that the patent to the Ajax issued prior to the location of the tunnel site and on the Mammoth Pearl and Monarch subsequent to such location; that the vein of the Victor Consolidated was discovered and located from the surface, was not known to exist prior to such discovery, extends throughout the entire length of that claim and on its strike crosses each of the veins in the claims of appellee upon which they were respectively discovered and located; that the tunnel cuts numerous blind veins underneath the surface of the claims of appellee, which do not appear upon the surface and were not known to exist prior to the location of the tunnel; that the vein of the Victor Consolidated was cut in this tunnel underneath the claims of appellee and ore of the value of four hundred dollars removed therefrom. It also appears that the patents upon the lode claims of appellee embrace the conflict with the Victor Consolidated without any reservation as to either surface or veins, and in this respect conform to the receiver's receipts upon such claims: that the patent on the Victor Consolidated excludes the surface in conflict with the claims of appellee and all veins having their apex within such conflict, which are the same exceptions contained in the receiver's receipt for that claim; that the portal to the Ithica tunnel site was at the date of its location on public domain; that work thereon was prosecuted diligently and that the location of such tunnel was in all respects regular; that all necessary steps were taken by appellant to locate the blind veins cut in such tunnel, which are in controversy in this case; that the record titles of the claims of appellee are vested in it and the record titles of the Victor Consolidated, the Ithica tunnel site and blind veins discovered thereon underneath the claims of appellee are vested in appellant. The record discloses that appellant offered testimony tending to prove that at the date of the location of its tunnel site mineral in place had not been discovered on the Monarch and Mammoth Pearl lode claims. The rights of the parties depend principally upon a construction of the following sections of the Revised Statutes of the United States:

"Sec. 2322. The locators of all mining claims heretofore made, or which shall hereafter be made, on any mineral vein, lode or ledge, situated on the public domain, their heirs and assigns, where no adverse claim exists on the tenth day of May, eighteen hundred and seventy-two, so long as they comply with the laws of the United States and with State, Territorial and local regulations not in conflict with the laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations. But their right of possession to such outside parts of such veins, lodes or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward as above described, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges; and nothing in this section shall authorize the locator or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim owned or possessed by another.

"Sec. 2323. Where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnels shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel of veins or lodes not appearing on the surface, made by other parties after the commencement of the tunnel and while the same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel.

"Sec. 2336. Where two or more veins intersect or cross each other, priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection; but the subsequent location shall have the right of way through the space of intersection for the purposes of the convenient working of the mine. And where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection."

The main questions presented for our determination, for convenience we summarize as follows:

1. Is appellant the owner and entitled to the ore contained in the veins of the Victor Consolidated claim, within the surface boundaries of appellee's lode claims?

2. Has appellant acquired, by virtue of its tunnel site location, the ownership and right of possession to the blind veins cut therein underneath appellant's claims, and is its tunnel entitled to a right of way through the lode claims of appellee?

3. Should appellant have been permitted to introduce evidence for the purpose of showing that there was no discovery of mineral in place on the Monarch and Mammoth Pearl claims of appellee prior to the location of the Ithica tunnel site?

All these were answered in the negative by the court below.

The first question represented involves, particularly, a construction of Sec. 2336, supra. The rights of a junior location to the ore of its vein embraced in the conflict with a senior have been determined by this court in Branagan v. Dulaney, 8 Colo., 408, and in several subsequent cases, which have adopted the doctrine announced in that case on that subject, and if we adhere to the law as announced in those cases, then the rights of appellant to the ore in the vein of the Victor Consolidated included in the territory of that claim conflicting with that of appellee are fixed and settled; for under these decisions it would be entitled to all this part of its vein, except where it intersects the veins of appellee's claims. It is contended by counsel for appellee that the ruling in Branagan v. Dulaney and the cases following it is wrong, and that this question should now be reconsidered. In opposition to a reconsideration of the rights of cross lode claimants, as declared by those cases, it is urged that the doctrine of stare decisis applies, and, even if wrong, should not now be disturbed, because the rule therein announced has been established for such great length of time as to become a settled rule of property in this State. We are aware of the gravity of reversing a long established precedent, and realize that it should not be disturbed, except for the most cogent reasons; that the people of this commonwealth have a right to presume that when a question has been once settled by this court, that its decision is correct, and that all may rely upon it. We understand, generally, that when a decision has established a settled rule of property, upon which rights are predicated, (and especially those relating to real estate), the law will be adhered to by the court announcing it, and those bound to follow its adjudications, even if erroneous—Black on Interpretation of Laws, Sec. 152—but this rule is not inflexible. Courts are not bound to perpetuate errors merely upon the ground that a previous erroneous decision has been rendered on a given question. If it is wrong, it should not be continued, unless it has been so long the rule of action, and relied upon to such an extent, that greater injustice and injury will result by a reversal, though wrong, than to observe and follow it Black on Interpretation of Laws, supra; Sutherland's Stat. Constr., Sec. 316; Boon v. Bowers, 30 Miss., 246.

The law as announced in Branagan v. Dulaney had led to much confusion, and has been a fruitful source of litigation. Under it doubts have been cast upon titles to mining properties, and supposed rights reduced to uncertainties. Judging by the experience of the past, coupled with the knowledge of the present, great activity in mining, to some extent caused, perhaps, by the marked improvements in mining and the reduction of ores, this industry is comparatively in its infancy in this State; and if the rule regarding cross leads as announced by this court is wrong, it will result in more injury in the future to perpetuate it than will temporarily be caused by its reversal. It is a matter of common knowledge that, ever since the decision of this court on that question, its correctness has been doubted by many eminent members of the bar of this State familiar with mining law, and has even been the subject of expression to that effect by this court—The Argonaut C. M. & M. Co. v. Turner, 23 Colo., 466—in which it was said, in speaking of the rights conveyed by patent to a mining claim, that it conveys all lodes or veins having their apexes within the boundaries of such claims, except, perhaps, cross lodes. This doubt has been generally entertained by those engaged in mining, so that notwithstanding the length of time that has elapsed since the rendition of the first decision of this court on this question, it is safe to assume that it has not been implicitly relied upon as a sound exposition of the law relating to cross leads, and that in the great majority of instances parties have governed themselves accordingly.

The law construed in Branagan v. Dulaney is an Act of Congress. The doctrine of stare decisis is based upon the assumption that the rules of law to which this doctrine applies have previously been determined by a court having final jurisdiction on the questions involved. For this reason, where the decision of a tribunal is subject to review by one having superior authority over it, for that purpose, or the question determined may be passed upon by such tribunal in another case, the doctrine of stare decisis does not apply with full force until the same questions have been determined by the court of last resort. The construction of an Act of Congress cannot be said to be authoritatively settled until passed upon by the highest court authorized so to do. This is the Supreme Court of the United States. It has never decided the question regarding cross veins as presented in the case at bar. The decision of this court on that question may be reviewed by that tribunal; so that although this court has given the statutes affecting cross lodes a construction which has since been followed by this State, nevertheless, as these same statutes are still open to construction by the highest tribunal of the land, their meaning on the subject of cross leads as involved in this case has not been finally determined so as to become stare decisis. In Arizona, California and Montana a different construction regarding the rights of cross lode claimants has been given from that announced by the Supreme Court of this State. Watervale M. Co. v. Leach, 33 Pac., 418; Wilhelm v. Silvester, 101 Cal., 358; Pardee v. Murray, 4 Mon., 234.

Whether or not the reasons given for this conclusion are sound, is not material. Sooner or later this question must be determined by the Supreme Court of the United States, and, when it is, the law thus settled must be followed by all the courts of the States and Territories in which the Act in question is in force. For these reasons we conclude that, although this court has passed upon the identical question regarding cross veins now involved, it is not precluded from again considering it, under the doctrine of stare decisis, or that the law as announced by this court in previous cases has become a settled rule of property in this State; and if upon a reconsideration of such question we conclude that our previous decisions thereon were wrong, we should not wait for a superior tribunal to so declare.

Before proceeding, however, with a discussion of this question, we suggest that were it not for the expression in the Argonaut C. M. & M. Co. v. Turner, supra, the action of the trial court, in refusing to follow Branagan v. Dulaney, would certainly be subject to criticism.

Previous to the Act of 1872 relating to mining claims, which with a few modifications has been in force ever since its passage, the rights of a locator were practically limited to the vein upon which his location was made. That was the thing granted; the rights to surface ground only attached for the purpose of the convenient working of the vein so located—no rights to any other vein except the one upon which location was made were given. Under the law then in force the surface ground, with the vein located, varied, controlled, as it was, in a great measure by local rules, or, in their absence, by the judgment of the Land Department in each particular case, as to the area necessary for the convenient working of the mine; so that, as might be expected, the patents issued under the law prior to the Act of 1872 embrace surface areas different and irregular in form. By this latter Act a marked change was effected. The surface area which could be controlled by one location was definitely fixed, and, this area being extensive, it was necessary that rights therein should be definitely declared. The rights of the locator to the mineral which might exist underneath such surface area was no longer limited to the one vein upon which he made his location. By Sec. 2322, supra, it is expressly provided that from and after the passage of the Act of which it forms a part the locat-

ors of all mining claims theretofore or subsequently made to which no adverse rights had attached on the tenth day of May, 1872, upon compliance with the laws and regulations governing their title, shall have the exclusive right of possession and enjoyment of the surface included within the lines of such locations, and of all veins throughout their entire depth apexing inside of such surface lines extended downward vertically, although such veins might so far depart from a perpendicular in their course downward as to extend outside of the vertical side lines. This section, standing alone, would seem to be clear, explicit and unambiguous. It provides a test by which the right of a locator to a vein inside of the lines of his location extended downward vertically should be determined, namely, if the top or apex of a lode was within the boundaries of his claim, as above designated, then he should be the exclusive owner thereof, provided, of course, that no adverse rights thereto existed at the date of his location

It is claimed by counsel for appellant that this section, by implication, excepts cross veins, because no extralateral rights are given such veins, such rights being measured by the end lines of the claim extended in their own direction, and as cross veins would not intersect these lines, no extralateral rights would attach to such veins. That question is now involved in th s case. Appellant is making no claim to any portion of the veins in controversy by reason of extralateral rights; and, besides, the vein of the Victor Consolidated is given no such rights, because by the judgment appellee is only declared to be the owner of that portion of the vein within the boundaries of its claims extended downward vertically. The most that can be said for this section on account of its phraseology is that cross veins are not given extralateral rights; and yet we can conceive of a location where a cross vein upon its strike may cross the one upon which the location is made, and intersect both end lines. But granting, for the sake of argument, that veins crossing the one upon which the location is made have no extralateral rights (but upon that question we express no opinion), this would only operate as a limitation as to such rights, and not as to others which would attach by virtue of a location, for naming limits of a grant is not equivalent to saying that nothing is granted which does not extend to those limits. Del Monte M. Co. v Last Chance M. Co., 171 U. S., 55. It is by virtue of Sec. 2336, particularly, that counsel for appellant contend that the portion of the vein of the Victor Consolidated in controversy belongs to the latter, their position being that by this section cross veins are excepted from the operation of Sec. 2322. It is the section construed in Branagan v. Dulaney. The rule adopted by the Court in construing it in that case is an arbitrary one, and never resorted to except in cases where the different sections of an Act are in conflict, namely, "as between conflicting sections in the same statute, the last in order of arrangement will control;" and, applying this doctrine, reached the conclusion that under Sec. 2322 the locator of a claim acquired no rights to cross veins apexing within the limits of his location.

The rule above announced is only applicable when there is an irreconcilable conflict between the different sections of the same Act, and no reasonable construction will harmonize the parts. But as the two sections under consideration do not conflict in all their terms, the real question presented in construing them is, does the latter qualify the former? It is presumed that each section is intended to co-act with every other of the Act of which it is a part, and that no one is intended to antagonize the general purpose of the enactment. Sutherland's Stat Const., Sec. 160. It is also a rule that in order to ascertain the legislative intent every section of an Act is to be construed—that it is to be construed as a whole—supra, Parkinson v. State, 74 Am. Dec., 522—and that construction which renders the whole Act harmonious and gives effect to every clause and part is to be favored. 23 Enc. Law, 309; Brooks v Mobile School Comms, 31 Ala., 227; People v. Burns, 5 Mich, 114; Patterson v. Sperrman, 37 Iowa, 36.

In Branagan v. Dulaney it was assumed that the "space of intersection" meant the intersection of the ve ns of conflicting cross locations, and as the mineral in this space was given to the prior location, and none other, that, therefore, the junior locator of a cross lead had all the ore of his vein within the space of intersection of the conflicting locations, save at the space where the veins intersected. Sec. 2336 does not purport to provide for the location of cross veins over territory included within a prior, valid and subsisting location. Its purpose appears to be to fix the rights of the claimants of such veins, to settle what might otherwise be conflicting rights between claimants of veins crossing or intersecting each other, and provide easements for the benefit of the claimants of such veins—Wilhelm v. Sylvester, supra—and unless in making such provisions it impliedly gives the junior cross claim the ore of his vein, except at the point where it intersects the vein of the senior location, the doctrine announced in Branagan v. Dulaney cannot be upheld, so that in order to determine what rights are conferred upon a junior cross claimant under this section the real question is, what is meant by the "space of intersection?"

The words emp oyed in the statute are to be construed with reference to its subject matter and the objects sought to be attained—23 Enc. Law, 322 Brewer's Lessee v. Blougher, 14 Peters, 178; Sedgwick's Stat. Constr, 359—as well as the legislative purpose in enacting it, and its language should receive that construction which will render it harmonious with that purpose, rather than that which will defeat it—Ibid, 319; Taylor v. Board of Comm., 67 Ind., 383; People v. Lacombe, 99 N. Y., 43. When ambiguous, its general intent as gathered from the statute furnishes a key by which its ambiguities may be solved, and thus its words given that meaning which will harmonize with that intent.—Sutherland's Stat. Constr., Secs. 218, 219. Conditions with reference to the subject matter of the Act, which it is apparent from its context it was necessary to provide for, may also be considered in ascertaining what is meant by that which is apparently ambiguous—People v. Lacombe, supra. It is evident from the provisions of Sec. 2322 that the intent of Congress was to give to the locator of a claim to which no adverse right had attached every vein apexing within the surface bound aries of his location, unless its intent is negatived by Sec. 2336. The words "intersect" and "cross" as used in this section are not strictly synonymous, and in using both, it must be presumed, intended to provide for different conditions. Veins might intersect, either on their strike or dip, and not cross. In that event it was necessary to provide what location should have the ore at the space of intersection, and it was declared that the prior location should have the ore within the space. In case they crossed, then a further provision was necessary, and it was provided that the junior location should have the right of way through the space of intersection for the convenient working of his mine. From a casual reading of this section it might be inferred that the "space of intersection" meant the intersection of the veins, but that does not necessarily follow, when its meaning is ascertained by one or more of the canons of construction which may be invoked is ambiguous, or different conditions exist which would control its import, or if, by giving it that limitation, the section in which it occurs conflicts with other portions of the Act. Previous to May 10, 1872, as before noticed, no rights attached to any vein except the one upon which the location was made. All rights which attached previous to that date were in no manner disturbed—Sec. 2322, supra, and Sec. 2344, ibid. In case of conflicting cross locations made prior to that date each locator would hold the vein located upon up to the point where they intersected on their strike. It was necessary to settle which should have the ore within the space of intersection of such veins, and, if they crossed, what further rights the junior locator should have. This was done. In such cases intersection would clearly mean the intersection of the veins. In the case of locations made under the Act of 1872, or prior to that date, which were substantially parallel, the respective veins in each might either intersect or cross upon their dip, in which event it would be necessary to provide which should be entitled to the ore within the space of vein intersection; and here, again, the meaning of "space of intersection," or the subject to which it refers, is the intersection of the veins. Again, under the conditions last noticed, the veins might unite, and to provide for this contingency it was declared that the prior location should take the vein below the point of union, including all the "space of intersection," which in that instance also refers to the intersection of the veins.

It may be urged that the construction thus far of this section is in conflict with Sec 2322, for the reason that under the latter the ownership of the space of intersection would depend upon which vein filled that space. Granted that this may be true, then we must invoke the rule that an Act must be construed as a whole, and if the construction of Sec. 2336 so far given modifies Sec. 2322, it is not violating any rule applicable to the construction of different sections of the same Act, which apparently conflict. This construction, however, does not cause any conflict between the two sections. The former gives to the locator the veins to which his rights attach throughout their entire depth, and if upon their strike—limiting the latter to rights which vested prior to the tenth day of May, 1872,—or in descending into the earth a body of ore bounded by the foot and hanging walls of his veins, extended to their general course, has been intruded, from another source, or if in descending they unite with other veins, these are not reasons why he should not be the owner of such spaces of intersection, or enlargements of his veins, caused by intersecting or uniting with others, but, on the contrary, according to the terms of Sec. 2322, he should be, provided, of course, that his title is prior to that of the location of the veins intersecting or uniting with his; so that the construction of these sections, under the conditions noted, render them harmonious, and Sec. 2336 simply recognizes that in conflicts in such cases priority of title should govern—a test which is clearly in harmony with Sec. 2322, and limits the provisions of Sec. 2336 thus far to easements only.

It may also be said that an easement would exist in favor of a junior claimant to follow his vein through the space of intersection caused by veins crossing upon their dip, because by Sec. 2322 the locator is entitled to follow a vein in its course into the earth outside the vertical side lines of his location. This may be true, but as to veins crossing on their strike, no such right is impliedly given by that section, and as we have endeavored to demonstrate, such a right was necessary under conditions above noted. In case of locations made subsequent to the Act of 1873 which cross each other, or those made under that Act which likewise conflicted with locations made prior to the date it took effect, it was also necessary to provide for po sible conditions, namely, the respective rights of the claimants of such locations, within the conflict of their claims, and particularly for a right of way for the junior claimant; and the vital question now to determine is, what is meant by the space of intersection in such cases as employed in Sec. 2336, and which party would own the ore of the vein of the junior location within that space. We again reiterate that the clear intent of Sec. 2322 was to give the locator of a claim to which no adverse rights were in existence at the date of his location, all veins apexing within its surface boundaries. That eminent jurist, Mr. Justice Brewer, with his extended experience in mining litigation, certainly spoke advisedly, in Del Monte M. Co. v. Last Chance M. Co., supra, (although the precise question now being considered was not there presented), when he said, in speaking of the rights of a locator under the provisions of this section: "Every vein whose apex is within the vertical limits of his surface lines, passed to him by virtue of his location. He is not limited to only those which extend from one end line to another, or from one side line to another, or from one line of any kind to another; but he is entitled to every vein whose apex lies within his surface lines." To the same effect is the language employed in Iron Silver M. Co. v. Elgin, supra. By that section he has been given title to all such veins. Such being the case, was it intended by Sec. 2336 to modify that grant or vest title in a cross-claimant to any part of a vein apexing within the boundaries of a prior, valid location, and especially what rights were intended to be granted or fixed under the conditions now being considered?

It provides that in such cases priority of title shall be the test by which the ownership of the ore at the space of intersection shall be determined. That is in accord with the rights conferred by Sec. 2322. So stating, however, is not equivalent to a grant. That language does not import that an exception is carved out of an estate which has already passed. Under the facts now in mind, the senior location, by virtue of Sec. 2322, would own the ore of the junior cross vein within the boundaries of his location, and before that right could be divested under Sec. 2336, it must appear from the wording of the latter that such right is thereby expressly excepted. That the language of this section is not susceptible of the construction that creates such an exception, it seems to us is clear, when we bear in mind that which we have already stated—that it does not pretend to deal with the location of cross veins over senior valid locations, but the purpose of which was to provide for easements, and settle rights which might otherwise be doubtful, or the subject of controversy, without some further declarations than those contained in Sec. 2322; and so we conclude that to render the two sections harmonious, the space of intersection as used in Sec. 2336, when applied to the facts now being considered, means the intersection of the c.aims. Barringer vs. Adams, 472, 473.

Under Sec. 2322 no rights were given the owner of a location crossing a prior one to invade the latter for any purpose in following his vein upon its strike. This was an important matter; without such right a portion of his claim might be rendered valueless, but if the expression "space of intersection" be limited to the intersection of veins as the space through which he should have a right of way for the convenient working of his mine, it would be of no avail, for he would have no right under which he could reach that easement; and so again, in order to recognize one which would be of any value to the junior cross-claimant, the space of intersection must also mean the intersection of the claims. Morrison's Mining Rights, 9th Ed., 115. The learned author of the work just cited, in treating the subject of title to ore included in the space of intersection as between conflicting cross-locations, under Sec. 2336, gives the following cogent reasons why, in his opinion, as between such locations, the owner of the junior has a right of way through the senior, but no right to the ore of the claim which he crosses:

"It was within the power of Congress, by a subsequent clause, to have made the crossing lode an exception carved out of the general grant of the words of the previous section, but has it attempted so to do? The only grant of Sec. 2336 is the right of way, which of itself implies that it is not a grant of the vein, but of an easement, to which the estate of the prior location is made servient."

"To give any part of the space of intersection to the holder of the later location would be to take from the older location something already granted to it. To create an exception out of this grant as he originally takes it, under Act of Congress, would require in the wording of the Act expressions as strong as are required to create an exception in a deed. An exception is equivalent to the reconveyance of land already conveyed. A right of way is not an exception, but a reservation, which may be inferred from any wording indicating an intent to create an easement. It takes nothing from the body of the grant of the first locator, but compels the first locator to use or hold his grant or claim subject to a right or privileges to the junior or overlapping claimant of reaching the other end of his claim by passage through the senior location."

Under the conclusion reached in Arizona, California and Montana, in the cases above cited, the ore within the space of overlapping claims would belong to the owner of the senior location. In the Arizona case, that conclusion was reached upon the ground that the expression "space of intersection" meant intersection of the veins; that they might so intersect upon either their strike or dip; but as to the former, it was limited to locations made prior to the tenth day of May, 1872. The learned judge who wrote the opinion in that case appears to have given it careful consideration, but in seeking to harmonize the two sections it seems to us fell into the error of (1) holding that the space of intersection meant intersection of veins only; (2) imposed a limit upon the provisions of the section when announced that it only applied to the intersection of veins upon their strike, under locations made prior to May 10, 1872, which is not warranted, either expressly or by implication; and (3) by so doing necessarily deprived a junior location, made under the Act of 1872, of the right of way across a senior location, if the former crossed the latter. In the California case, the eminent jurist who wrote the opinion, seems to have entertained similar views regarding the application of this section to rights which vested prior to May 10, 1872, but except as to those rights, inclined to the conclusion that this section only referred to the intersection of veins upon their dip, which would also result in depriving a junior cross-claimant of a most important right. We think that Chief Justice Beatty, who concurred in the opinion, in that case, more nearly announced the true doctrine when he said:

"I think, however, that too much is conceded, both in the opinion of the Court and in the argument of counsel for respondent, in assuming that the provisions of Sec. 2336 cannot be applied to locations made since the passage of the mining law of 1872 on veins which intersect upon their strike, without bringing it in conflict with the plain terms of Sec. 2322. This wholly unwarranted assumption has been the source of all the trouble and difficulty which the Land Office and some of the State courts have encountered in their attempts to construe provisions of a statute which are in perfect harmony, but which have been erroneously supposed to be inconsistent."

The opinion in the Montana case is not altogether clear, but seems to limit the space of intersection as applied to the facts there presented, to the intersection of the conflicting claims, but does not enter into discussion of the subject; so that although we agree with the conclusion reached in each of those cases, we cannot accept the limitations imposed upon the provisions of this section, or indorse the reasons advanced by the learned writers of the opinions in the Arizona and California cases.

Our conclusion is that the provisions of Sec. 2336 apply to locations made under the Act of 1872 as well as before, refer to the intersection or crossing of veins either upon their strike or dip; that the space of intersection, in determining the ownership of ore within such space, means either of intersection of veins or conflicting claims, according to the facts in each particular case, and grants a right of way to the junior claimant for the convenient working of his mine through such space upon the veins (underneath the surface) which he owns or controls outside of that space. This construction renders the two sections entirely harmonious, gives effect to every clause and part of each, and in so far as Sec. 2336 regulates or in any manner provides for rights as between conflicting claims, it applies only to intersections consistent with all the provisions of Sec. 2322.

As we understand the ruling of the Land Department in issuing patent for conflicting mining claims, there is always excepted from the surface of the junior the portion conflicting with the senior, as well as all veins apexing within such conflict. This practise is in accord with our views: and although such a construction would not be controlling, the interpretation put upon the Act by those whose duty it has been to construe, execute and apply it is entitled to much weight. 23 Enc. Law, 339; Frost v. Pfeiffer, 26 Colo., ——, 58 Pac., 147; People v. Lefevre, 21 Colo., 218.

The receiver's receipt, as well as the patent issued appellant, excepted therefore all veins apexing within the conflict between its claim, the Victor Consolidated, and those of appellee. The patents to the latter granted all such veins, and thus all rights attaching by priority of location have been preserved to appellee. The location of the Victor Consolidated was junior to that of the claims of appellee, and from this fact, and the views expressed, it follows that the appellant cannot complain of the judgment of the lower court in so far as it awards to appellee the vein of the Victor Consolidated, and all veins apexing within the boundaries of the claims of the latter, and awarded damages for the removal of ore. These veins are in conflict with the case of Branagan v. Dulaney, and that case, as also those of this court following it, in so far as they conflict with the doctrines now announced regarding conflicting cross claims, are overruled. The language of the judgment of the lower court regarding the rights of appellant in the conflicting territory, is very explicit, but only extends to acts of trespass, and does not prohibit those which it may exercise therein by virtue of its ownership of the Victor Consolidated claim.

The determination of the second question presented involves a construction of Section 2323, supra. The contention of counsel for appellant is that in all patents for lode claims, blind leads are excepted, and that the patentee takes no title thereto by virtue of his patent. In answer to this, we have only to advance one step further in the construction of Sec. 2323, and call attention to the fact that the test there applied by which the ownership of veins embraced in a valid, subsisting location is determined, is, that they apex within the boundaries of his claim extended downward vertically, without regard to where such apexes may be with reference to the surface; so that again the question presented is: does Sec. 2323 conflict with or in any manner modify the provisions of Sec. 2322? and in construing them the same rule must be observed relative to the construction of an Act of Congress as in sections that have already been invoked. The former provides what rights may be acquired to blind veins discovered in a tunnel run for the development of the vein, or for the discovery of mines, but upon what ground may such tunnel be run, or within what territory must be the blind leads discovered therein be located, in order to give the discoverer any rights thereto? A valid location of a mining claim, so long as it is in full force and effect, operates as a bar to a second of the premises so claimed —Belk v. Meacher, 104 U. S., 279; Gwillim v. Donnellan, 115 U. S., 45; Del Monte M. Co. v. Last Chance M. Co., 171 U. S., 55. The only exception is that a given location leaves open to others such rights therein as do not attach by virtue of such location; in other words, that a location only carries with it such rights as it is entitled to under the law by virtue of which it is made, and that all rights not attaching are reserved to others. It is upon this ground that appellant contends that its right to the blind lead in question attach; that is, that under Sec. 2323 these veins are impliedly excepted from the locations and patents of appellee's claims. If such a conclusion can be deduced from the sections under consideration, they are hopelessly in conflict, for, first, there is granted all veins the ownership of which is determined in the manner we have designated, including blind, and then immediately following the grant to the latter is withdrawn. A location can take no rights which conflict with a prior, valid one so long as it is kept alive. The law contemplates, and the authorities recognize, that the very life of a mineral location depends upon the fact that it is made upon unappropriated mineral domain, and upon the one exception already noticed, this requirement extends to the entire location—that is, it cannot embrace any ground, nor can it initiate any rights within the boundaries of a prior, valid, subsisting location, except those reserved from the latter. This rule extends to all classes of mineral locations: in other words, priority determines the rights between conflicting locations. The tunnel of appellant was commenced upon ground open to location, but at the time it was located and work thereon commenced, the ground embraced within the claims of appellee had already been located and claimed as lode claims, so that the rights of appellee to the ground within the boundaries of its claims, and the leads in question, had attached before appellant attempted to initiate any title thereto, and therefore none attached by virtue of the location of, or work upon, its tunnel site, unless it appear that by virtue of Sec. 2323 a tunnel for the discovery of blind leads may be projected across and extended into prior, valid, subsisting locations, and title to the blind leads discovered within the boundaries of such claims thus be secured. It provides how inchoate rights to blind veins may be initiated; how they may become absolute; but nowhere does it in terms, either expressly or implicitly, declare that for these purposes it may be projected into or across prior, valid locations To give it the interpretation that it does is to inject a meaning of which it is not susceptible, renders it irreconcilable with the provisions of the section preceding, and overthrows the doctrine of priority—the foundation upon which mining rights rest. It does not provide that under a location for tunnel site purposes a right is granted to search for minerals in lands belonging to another, or that thereby a location for such purposes can be carved out of appropriate public domain, while limiting it to locations for tunnel site purposes to ground not previously appropriated renders it harmonious with Sec. 2322. That the latter was the clear meaning and intent of Congress in passing the Act, of which these two sections form a part, is apparent from the further reading of Sec. 2323, which in terms provides that locations on the line of the tunnel contemplated by this section, of veins not appearing on the surface, made by others after the commencement of work thereon, and while it is being prosecuted with reasonable diligence, shall be invalid, a clear recognition of the controlling principle of priority. Counsel for appellant assert that the Enterprise M. Co. v. Rico-Aspen M. Co., 167 U. S. 108, and Ellert v. Campbell, 18 Colo. 510, affirmed in 167 U. S. 116, are authority for their propositions, that blind leads are excepted from all locations and patents; that no rights to such leads attach until discovered; that a tunnel site may be projected across and its tunnel extended underneath previous valid, subsisting locations, and title to blind leads discovered in such tunnel within the boundaries of such claims not known to exist previous to the commencement of work thereon may be thus acquired by the owner of su h tunnel. Neither of such cases so hold, and while they cannot be said to be directly in point, because the facts in the case at bar and those are entirely different, yet by analogy the principle upon which the right to blind leads discovered and located under the section of the statute relative to tunnel sites which was applied in those cases is the same as that upon which we base our decision here, viz., priority of location: for in each of those cases the tunnel site was located prior to the date of the location of the lode claim within territory embraced within the tunnel site location, and within the boundaries of which the blind leads were discovered and located, which were the subject of controversy. It was upon this ground, as we read and understand the opinions of these cases, in connection with the facts, that the inchoate rights of the tunnel claimants to such leads were predicated, and by virtue of which, when discovered on the line of the tunnel, they become absolute. On the subject under consideration one further question needs to be determined, namely: Has appellant a right of way for its tunnel through the territory of appellee? It is contended by counsel for appellant that under Sec. 2338, Rev. Stat. U. S., and Sec. 3141, Mills, it is entitled to such right. The first of these sections provides that in the absence of necessary legislation by Congress the Legislature of a State may provide rules for working mines involving easements, drainage, and other necessary means to their complete development, and that these conditions shall be fully expressed in the patent. The section of Mills' referred to provides that a tunnel claim located in accordance with its provisions shall have the right of way through lodes which may lie in its course, but it will be observed that this section only refers to tunnels located for the purpose of discovery, and if any of its provisions are still in force, which appears to be doubted in Ellert v. Campbell, supra, they can have no application to the case at bar, because the section of the Revised Statutes only provides for easements, for the development of mines; and the section of Mills' relied upon does not attempt to confer any such rights, but is limited to the one purpose of discovery. In this respect it has been clearly superseded by the Act of Congress; so that if appellant is entitled to the right claimed it must attach by virtue of some provision of this Act.

Mining rights are statutory, but not purely so. They relate to real estate, and such rights as are not defined or limited by statute are still controlled by the rules of the common law. Such rights as are conferred by a valid, prior location, so long as it remains in full force and effect, are preserved from invasion, and cannot be infringed upon or impaired by subsequent locations—Lindley on Mines, Sec. 363—and are as fully protected under the rules of the common law as any other classes of real estate. Under the statute, the subsequent locator has not right to penetrate a senior valid, subsisting location underneath its surface boundaries extended downward vertically, except for the purposes specified in the mining laws. We will not undertake to specify what these exceptions may be, but so far as they are not fixed by statute, the possession and enjoyment of the ground underneath the surface of a valid, subsisting location cannot be invaded. These exceptions do not in-

(Continued on Page 662.)

The Caving System of Mining.

The first to introduce into the mines of the West the caving system is Capt. J. R. De Lamar at his Utah mines, the result of which will be watched with interest by miners throughout the country.

As an outgrowth of the necessity of a cheap method of mining the iron ores of northern Michigan the caving system has resulted. It requires a relatively small amount of timber for the quantity of ore recovered, and fatal accidents are not more common than in other mines employing the systems common to the western mining regions. The different mines of the iron ranges employ somewhat different systems, depending upon the character of the ore and wall rocks.

In the proceedings of the Lake Superior Mining Institute, E. F. Brown gives the following brief but clear idea of the method employed in the Pewabic mine, at Iron Mountain, Mich.:

The system of mining herein described has been in successful operation at the Pewabic mine, Iron Mountain, Mich., for a period of three years, and about 600,000 tons of iron ore has been extracted from the points in the mine where it has been found advantageous to make use of this method exclusively. This system has been employed most extensively upon a large body of highly silicious, hard hematite ore, of uniform quality.

For convenience in operating, the ore body is first divided into blocks, having a length, on the trend of the strata, of about 250 feet, the width of the blocks depending upon the distance between the slate walls, or foot and hanging. The height is the distance between levels, ordinarily 100 feet. The accompanying plates show one of these blocks of ore in various stages of preparation for actual mining, also the condition of the overburden, consisting of broken sandstone and old timber, which had been caved by earlier mining operations.

Fig. 1 shows the plan of crosscutting and raising

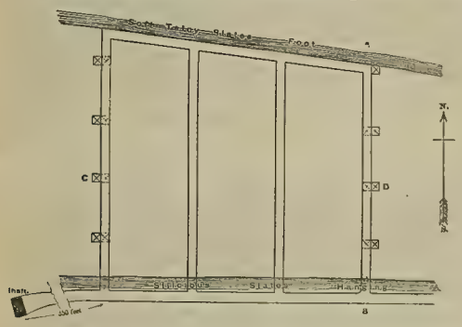


Fig. 1.—Plan Showing Drifts, Crosscuts and Raises Preparatory to "Block Caving" in Pewabic Mine.

in blocking out the ore, also the location of the ore with reference to the main level.

The main level is driven in the hanging wall slate, about 20 feet from the ore body, and parallel with its trend. From the main level, crosscuts are extended across the ore body to the foot wall. We usually make four crosscuts, thus dividing a block of ground 250 feet long into three blocks of about 80 feet each. Adjacent to the two crosscuts, which mark the eastern and western boundaries of the original block, we start upraises 50 feet distant from each other, and extend these upraises 80 feet, or within 20 feet of the level immediately above.

Figs. 2 and 3 are vertical sections taken

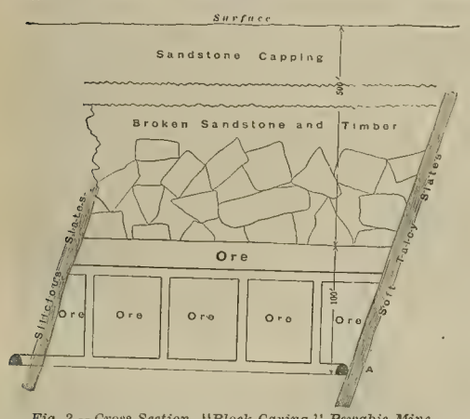

Fig. 2.—Cross Section, "Block Caving," Pewabic Mine.

through *A-B* and *C-D* on Fig. 1 and show the upraises in detail. Chutes are constructed at the bottom of the upraises, and, commencing at the top, underhand stoping is carried on until a trench 8 feet wide and 80 feet deep has been cut across the ore body from foot to hanging wall.

In the underhand stoping the ore falls into the chutes when blasted, and is run into the tram cars by gravity. During the time required to cut the trenches across the ends of the block, we are also employed in undercutting it, and when the trenches

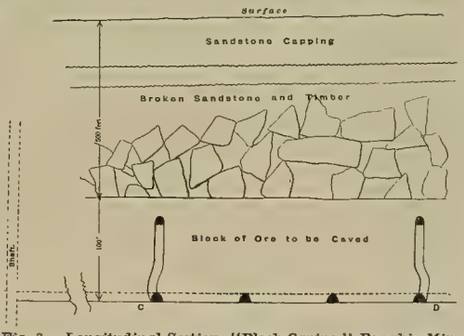

Fig. 3.—Longitudinal Section, "Block Caving," Pewabic Mine.

are completed we have the bottom of the block about in the condition shown by Fig. 4. That is, we have two strong pillars alongside of the main cross-

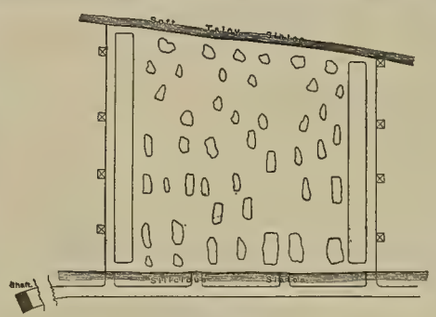

Fig. 4.—Plan Showing Block of Ground Ready for Caving, Pewabic Mine.

cuts on the ends of the block, while the balance of the ground is resting on small legs of ore, irregular in size and shape.

These legs and pillars are then made as small as is consistent with safety to our miners. The remaining portion is then drilled, and when all have been drilled, they are blasted in sections. The ends of the blocks being cut off and the entire block thoroughly undercut, the ore soon begins to cave. This usually occurs in large masses of many hundreds of tons each.

To illustrate the hardness of the ground and the results obtained, it may be well to state that no timber is used in prosecuting the work just outlined, and that it requires several weeks for a block of this ore to settle a distance of 7 feet, but within six or eight months the ore becomes crushed so that four-fifths of the entire block could be put through a 3-inch opening. After the block of ore has settled down to the original level, and been sufficiently crushed to allow easy driving of crosscuts, the two crosscuts in the central portion of the block, as shown on Plate V, are advanced through the caved ore, and from these crosscuts drifts are run to the eastern and western boundaries of the caved territory. These drifts are usually located about 25 feet apart, on the line of the crosscuts. The drift nearest the foot wall is connected with the adjacent crosscut, and from this drift short crosscuts are extended, at intervals, to the foot wall.

These drifts and crosscuts are all closely timbered, and after the initial timbering require but little attention in the way of repairs. The work of mining is now commenced by allowing the caved ore to run into the drifts and crosscuts through the opening in the end, or breast, of each. The broken ore is sim-

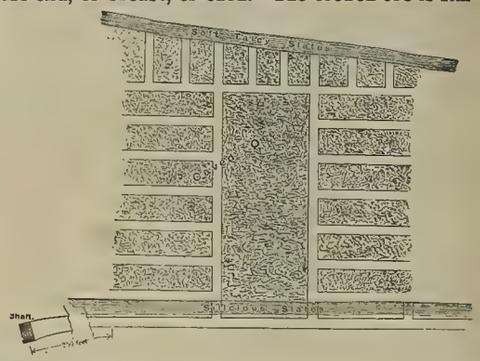

Fig. 5.—Plan Showing Drifts and Crosscuts Through the Block After Being Caved, Pewabic Mine.

ply shoveled into the tram cars and taken to the shafts, the breast of the drifts always being full of broken ore.

When a full output is desired, the crew consists of one miner and four shovelers at each of the points in operation. Two of the shovelers are always employed in filling the ore, while the other two are tramming it to the main level. No drilling is required, and but little powder is used in blasting.

Drawing the ore in this manner forms funnel-shapped spaces in the body of broken ore, and these are eventually filled by the caving of the timber and broken sandstone from the old level above. When the ore has been so far removed, at any point, that the waste material is shown in the working faces, we blast a few of the timbers in the drift and draw our point of operations nearer to one of the main

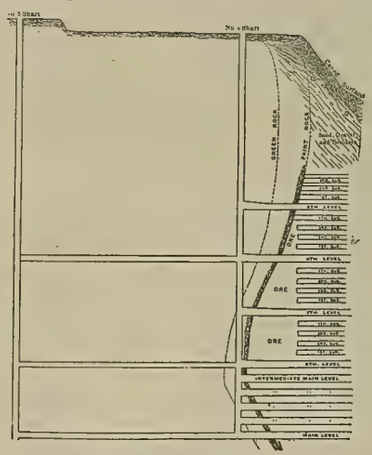

Fig. 6.—Vertical Section Showing "Sub-Drifts," Chandler Mine.

crosscuts. This operation is continued, and repeated until the ore in the territory formerly traversed by the drifts has been exhausted and replaced by the waste from above. Other drifts from the main crosscuts are then driven in the pillars remaining between the first drifts, and the operation repeated as in the first work. In actual work, it is found possible to draw the ore for 3 or 4 feet on

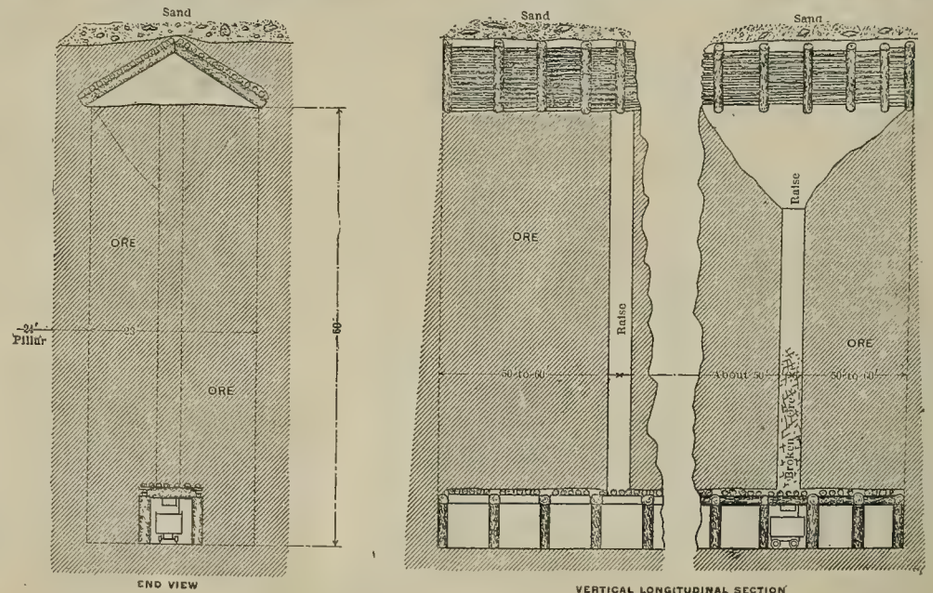

Fig. 7.—Stull Rooms Used in the Fayal Mine.

either side of these drifts; consequently the second set of drifts practically cleans up the broken ore.

The typical block of ore, herein described, was caved during the fall of 1897. This block contained, originally, about 350,000 tons of ore, and it has yielded about 120,000 tons during the shipping season. A much larger output could have been obtained if desired. We have never had any fatal accidents in connection with operating under this system, and it can, without exaggeration, be called a safe method of mining. With modifications to accommodate varying conditions, this system has been applied to the mining of soft ore bodies, and the results obtained in this direction have been satisfactory to us.

Figures 1 to 5 show the progress of development of a block of ore in the caving system as practiced at the Pewabic mine.

At the Chandler mine, in the Vermillion range, the method of mining is somewhat different. The accompanying cut, Fig. 6, shows a vertical section through two of the principal shafts. The system employed at this mine down to the eighth level is described by Prof. F. W. Denton in the Transactions of the American Institute of Mining Engineers, as follows: Main levels are driven 75 feet apart and generally there are two main drifts at the bottom of each block, running approximately parallel on opposite sides of the block of ore. From these main drifts raises are put up at intervals of about 50 feet, and from these raises four series of sub-drifts are run. The sets in the main drifts are made of 9-foot caps and 7-foot legs, and those in the sub-drifts of 6-foot caps and 6-foot legs. This leaves about 8 feet of ore between the sub-levels. The sets are placed 3 to 4 feet apart. As the raises are put up, sets are placed to start the first sub-drifts; but these drifts are not started at once, but are omitted to strengthen the main drifts until the fourth, third and second subs are worked out. When the sub-drifts are completed, the block of ore between any two levels is honeycombed with drifts with vertical intervals of 8 feet of ore. When mining above has been completed, the removal of the ore pillars on the top subs begins. The pillars are sliced away, the back is caved, and the caved ore is removed in wheelbarrows to the chutes leading to the main level below. The chutes are 4 feet square and lined with 2-inch plank placed on edge. When the sand or overlying timber appears, a new slice is taken off the pillar and the back of ore is caved as before, until finally all the sub-drifts have been worked out, when the operation of caving is continued in the block below, which, in the meantime, will have been honeycombed by the first or preparatory sub-drifts.

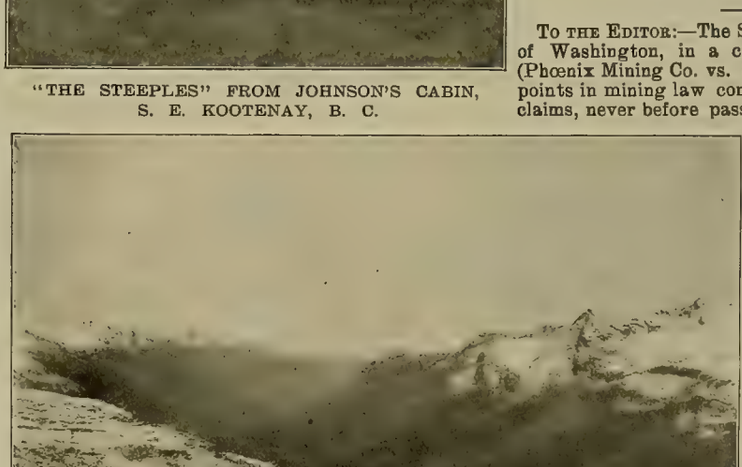
Below the eighth level the method of mining has been modified. What are called intermediate main drifts are driven through the ore at intervals of 20 feet instead of 75 feet, and no sub-drifts are used. The intermediate main drifts are of the regular size, 9-foot caps and 7-foot legs, which leaves about 10 feet of ore to be caved, instead of 7 or 8 as before. Stations are made at the shaft for each intermediate main level. Under this modified system, the removal of each 20-foot block will be done as before, but the putting up of raises will be saved; and it is intended to use cars, and thus do away with wheelbarrows as far as possible.

Owing to the presence of sand and broken "paint-rock" in the caved ground above, the ore obtained by the caving process is more or less mixed with these impurities, and the percentage of iron in it is lowered from 64% to 60%. This ore, however, is obtained very cheaply; and it is claimed that this compensates for the injury to its quality. Although broken up, the ore in its undisturbed state is really quite hard. In driving main drifts, machine drills have to be employed frequently.

Top lagging is employed in the sub and main drifts, and side lagging where necessary, but no attempt is made to lag the bottom of the sub-drifts before caving the back.

At the Fayal mine, in the Mesabi range, there is from 65 to 90 feet of surface over the ore. The top of the ore slopes south. The method of mining has been by rooms, and by top drifting and caving. The rooms are about 24 feet wide, with pillars between of about the same width, or a little less. The rooms are carried up to the overlying sand, which may make them as high as 65 feet; the length may reach 300 feet. All rooms are filled, after they are completed, by running in the glacial drift that forms the roof, from the top of a raise put through to the surface for the purpose.

When rooming is not employed raises are put up to the sand, and from the tops of these raises what are called "sub-drifts" are put through the ore, dividing it up into a series of blocks or pillars one drift set high. These "subs" are timbered with drift sets. The first series of sub-drifts, just under the sand, are known as "A subs." When the "A subs" run into rock or the overlying sand a second series of subs known as "B subs" is run 12 feet lower, center to center, than the "A" subs. The "C" and "D" subs follow in order.



One series of subs is not extended under the one above, as a rule, until the upper one has been worked out; and, when necessary, in order to reach timber or ore chutes, the drifts are staggered so that the roof of the lower drift does not come entirely under the floor of the upper drift.

After blocking out the ore by these drifts the pillars or blocks are mined by slicing and caving, *i. e.*, a drift will be run along the farther side of a pillar; then this drift will be caved, and a second slice taken off alongside the first, and the operation will be repeated until the block has been mined. Each slicing drift is not run entirely across the block, but two drifts are started, one from each side, to meet half way down the side of the block.

Before caving these slicing drifts 1 inch boards of the cheapest grade obtainable are placed over the bottom of the drift, to keep the sand from mixing with the ore mined from the next lower series of drifts. The raises used for ore chutes are placed about 100 feet apart, and thus far regular mine cars, running on tracks, have been used in the sub-drifts.

"THE STEEPLES" FROM JOHNSON'S CABIN, S. E. KOOTENAY, B. C.

NEAR HEAD OF MIDDLE FORK SPILLIMACHENE RIVER, B. C.

The first main sub-drift timber sets are made of 12-foot caps and 8-foot legs, making 10 by 8 feet in the clear; and the sets used in slicing have 8-foot caps and 8-foot 8-inch legs, making 7 feet 6 inches by 8 feet in the clear. The top of the ore is irregular, a condition which often leaves bunches of ore above the top of the subs. This ore is obtained during the slicing and caving by raising up above the drift sets and, if necessary, putting in "baby" sets. When the next lower drifts are run under the caved ground all of the 12 feet of ore is removed as follows: The legs being 8 feet long, the caps 1 foot in diameter and the lagging 6 to 8 inches thick, a total excavation of about 10 feet is required to make room for the sets, and the space remaining between the top of the lagging and the planking above is filled with blocking, the planks being allowed to settle as little as possible.

At first the rooms were carried up by overhand stoping, with the aid of square-set timbering, in the usual manner, the square sets being 7 feet 6 inches from center to center of legs and the rooms therefore three sets wide. Recently, however, an experiment has been tried of putting in what are termed in the mine "stull rooms." The top of the room is first cut out by driving a wide drift just under the sand and supporting this drift with saddle-back timbering, which becomes the roof of the room. This roof timber is put in by driving from the sub drifts on the same level, thereby avoiding the hoisting of timbers. The rooms could be started from the tops of raises if necessary. After the roof is thus securely supported, the ore is stoped underhand. Fig. 7 shows the saddle-back over the stull room.

A special feature of the Fayal mine is the use of "timber slides" for getting timber into the mine, which are made by putting up raises to the surface, 5x5 feet in section, and equipping them with skid-ways, down which the timber is allowed to slide. The skid-ways are curved at the bottom to diminish the velocity of the timber. The angle of the first slide was 45°; but the later ones were put at 38°, which is considered to be about the best angle.

Picturesque British Columbia.

About the headwaters of the Middle Fork of Spillimachene river, in British Columbia, a large number of claims have been located and considerable development work done, notwithstanding the great altitude—8000 to 9000 feet—and the heavy snows of winter. The accompanying illustration is from a photograph taken near the head of the stream. International basin lies at the head of the creek and is 8000 feet above the sea, the surrounding hills rising 1000 feet higher. It is above timber line and is surrounded by glaciers. It snows in this region every month of the year, though the summer snows are light and quickly disappear. The country rocks are slates, schists and quartzites, through which course quartz veins carrying sulphides of the base metals and gold.

In British Columbia the midsummer days are long, as evidenced by the engraving of The Steeples, taken from Johnson's cabin in Southeast Kootenay after 8 P. M. The picture shows the picturesque scenery of the locality, which is in striking contrast with that at the head of the Spillimachene.

Recent Mining Decision.

To the Editor:—The Supreme Court of the State of Washington, in a case recently handed down (Phœnix Mining Co. vs. Scott), decides several new points in mining law concerning unpatented mining claims, never before passed upon in this State, and some of which are not in harmony with the decisions of other States.

The court holds, first, that an unpatented mining claim is not community property and the wife of the locator need not join in a deed to convey the same.

Second, that the estate of the locator in an unpatented mining claim is not such an estate as will be subject to a lien of a general judgment against the locator.

The statute of this State provides that a judgment shall be a lien upon all the real estate of the debtor that is not by law exempt.

The court also holds in this case that an unrecorded mining deed has priority over an execution levied on a mining claim; and as the subject of innocent purchaser is not mentioned by the court, it practically holds that a levy on a mining claim which is unpatented is void.

The court says: "At common law, a judgment did not attach to a mere equity, though the equity was accompanied by possession." A legal location of a mining claim would seem to be more than a mere equity accompanied by possession, when the owner can, without obtaining a patent, extract all of the ore therefrom if it amounts to millions of dollars and leave it practically worthless for the one who finally obtains the patent.

The tendency of all the decisions of the court of this State is to treat this class of property more like personal property than real estate, and a as mere right of possession rather than as real property, which may ripen into a fee simple title.

The ruling of this court on this subject is at variance with the law of both Colorado and California, and it seems to me that our court has taken a middle ground between the law of Canada, which holds that an unpatented mining claim is a personal property and can be transferred by a bill of sale, and that of the United States, which holds such property to be real estate.

F. M. Jeffery.

Republic, Wash., Nov. 28th, '99.

The Nature and Nomenclature of Veins.

In the monograph of the United States Geological Survey on the "Quicksilver Deposits of the Pacific Slope" Dr. George F. Becker contributes the following description of mineral veins and ore deposits, which applies equally to the ores of other metals as well as to those of quicksilver:

Excepting when ores are deposited in beds, like coal, or in placers, like gold gravels, the existence of open subterranean spaces of greater or less size is a necessary condition for the formation of ore bodies of any kind. The ore may be deposited in openings which existed before deposition began, and which either were cracks between masses of rock broken asunder or were interstices in porous rock like sandstone. Room for the ore may also be made by solution of the rock mass either before ore deposition or during that process. It is a mistake, however, to suppose that the masses stoped out in the exploitation of mines usually represent spaces which were empty before the deposition of ore in them. It is said that cases occur in which open caves in limestone have been filled with ore, but cavities of this kind appear to be confined to limestone, and to have formed only above the water level of the district by the solvent action of surface waters charged with carbonic acid. Ore deposits, however, are by no means confined to limestones, and are more often found in rocks of this class which have never been drained than in those which have been exposed under the conditions needful for the formation of caverns. It is also conceivable that yawning fissures should form in the earth's crust, and that they should be filled up solely with ore and gangue minerals; but such cases, if they exist, are exceptional. All observations and theory point to the conclusion that most fissures are formed under a compressive stress of greater or less violence, or that a tendency to compress the rocks into folds gives rise to fissures and faults when the applied force exceeds the tenacity of the rocks. It is also well known that in faulting the hanging wall commonly sinks relatively to the foot wall. Fissures formed under such conditions cannot yawn. The walls must come together at intervals, and the intervening spaces must be filled to a greater or less extent with the fragments of wall rock. Observation shows that veins very usually answer to this description and that the space occupied by ore corresponds, in great part, to the interstices between fragments of wall rock which loosely filled the fissure before the ore was deposited. This is observed with particular frequency in large veins, while small ones are comparatively free from rock fragments. Irregular ore bodies connected with fissures still more often represent masses of rock fragments rather than caverns.

In some cases irregular chambers, connected with fissures, are solidly filled with ore and gangue minerals. Such bodies are found in limestones under conditions which preclude the supposition that they represent pre-existing caverns, and they are usually accompanied by evidences of substitution of ore for carbonate of lime. The deposits of Eureka, Nevada, and Leadville, Colorado, are of this type. In these cases broken rock seems originally to have filled the spaces in question, much as stopes in mines are often filled with rock by miners to prevent their collapse after the removal of the ore. Solutions of ore finding access to these spaces through the main fissures have come in contact with very extensive surfaces of limestone. The limestone has been dissolved and ore has replaced the rock, molecule for molecule. Whether similar substitution occurs in other rocks than limestone, and with other ores than those of lead, has not been sufficiently investigated.

Fissures in the earth's mass would extend indefinitely, both laterally and vertically, if the rocks possessed neither plasticity nor elasticity. No rocks, however, are devoid of either of these properties. It is well known, accordingly, that fissures are not of indefinite length. They sometimes pass over into folds, as several geologists have pointed out, and even in granite areas dykes of eruptive rock may sometimes be observed, which diminish gradually in width to a fine edge and disappear. There is every probability that fissures also die out in depth in similar manner, though where considerable faults have occurred the depth of a fissure must be very great. Many fissures certainly penetrate from the surface of the earth to the foci of volcanic activity, a depth at least equal to that at which earthquake shocks originate, or several miles from the surface.

When the term fissure vein is used without any qualification it brings to mind a very simple and common form of deposit, a fissure with well-defined walls, usually nearly straight, or curving gradually and including vein matter which is commonly composed of ore gangue, and fragmentary masses of country rock. It appears to me very desirable not only to call a deposit of this kind a simple fissure vein, but to limit the application of this term to veins of this kind.

Where the formation of a fissure is accompanied by a strong compressive stress groups of parallel fissures form, often passing over into a common fold at each end. The dislocation is then distributed over a number of parallel surfaces instead of a single surface, and this distribution takes place according to a definite law, which I have examined on other occasions. In some cases such fissures form with great regularity and are distinct from one another as far as they can be traced. If ore-bearing solutions enter such ground, they deposit distinct parallel veins. Such deposits are naturally described as groups of parallel veins.

In many cases the tendency to the formation of groups of parallel fissures is obstructed, perhaps by irregularities in the tenacity of the rock or by the action of complex forces. In such instances approximately parallel fissures form, which die out in the direction of their strike, being replaced by others to one side or the other. More or less diagonal stringers must then exist, connecting the principal crevices. Sometimes fissures of this kind run together and separate again, without, however, diverging at any high angle.

In all cases these veins are linked together by direct continuations of divergent strike or by small stringers intersecting the layers of rock which intervene between them. It appears to me convenient and natural to call such systems "linked veins," to distinguish them from simple fissure veins and parallel systems of veins on the one hand, and from netted (or reticulated) veins on the other.

There are still other less usual groupings of veins which do not need to be christened. No one would hesitate to speak of a system of veins which radiated from a central point as radiating veins, or of a vein which sends off numerous stringers into the country rock as a branching vein, and such descriptive terms are clear and precise.

A slight degree of irregularity in the tenacity of the rocks or in the character of the rupturing force suffices to produce linked fissures instead of groups of parallel fissures. Greater variations in the rock or a torsional stress accompanying the dislocation will result in crushing portions of the country rock adjacent to the main fissure. This crushing will not, as a rule, be confined to a simple zone parallel with the fissure, but will reduce only occasional masses of rock along the fissure to fragments. When in such cases ore and gangue minerals are subsequently precipitated the deposit will be confined to the main fissure where the adjoining country is unbroken, but it will spread into the neighboring rock where crushing has occurred, the excrescent ore bodies being nevertheless merely lateral extensions of the filling of the fissures. Miners then usually call the entire occurrence a fissure vein, and with no little reason, since the whole deposit is so evidently and closely dependent upon the existence of a fissure. In some of the simpler cases of this kind even formalists will grant the applicability of such a term as irregular vein, or vein with irregular walls. "Pipe vein" has also sometimes been used to express structure of this kind, but this term has been applied in such various senses as to be objectionable. When the irregularity of the deposits is great, it has been usual for mining engineers and geologists to describe rather than to name them, to speak of stockworks and impregnations connected with them, and the like. It does not seem expedient, however, to designate ore bodies so closely related by different names unless the connection is also expressed by some appropriate term. The connection existing between the various portions of a deposit is at least as important as the form of the various parts, and, if miners err in giving a wrong impression as to form, the usual nomenclature of mining geologists ignores the close interdependence recognized in the language of the miners.

It seems to me that deposits of this description may conveniently be called "chambered veins," and that the irregular, excrescent bodies of ore of such deposits may fitly be denominated vein chambers. I propose these terms to express the external form only, and to embrace irregular ore bodies contiguous to a fissure, whether they consist of reticulated masses, of impregnations, or ore deposited by substitution. A chambered vein may, then, be defined as a deposit consisting of an ore-bearing fissure and of ore bodies contiguous with the fissure which extend into the country rock. The term is intended for use in contradistinction to the term fissure vein, or, more explicitly, simple fissure vein, which is thus restricted to those cases in which the occurrence of ore is limited to a single, defined fissure. Transitions between the two forms are not infrequent, and such occurrences may be referred to conveniently as veins which are to some extent chambered, or which show a tendency to chambering.

In granites and gneisses it is not infrequently the case that simple fissure veins are formed which, from the croppings downward, are very irregular. I doubt, however, whether, if in these cases the surface still remained as it existed at the time when the fissure was formed, the superior portion of the deposits would be found to possess an equal degree of regularity. When a fissure is formed a fault almost or quite invariably accompanies it, for it is a force tending to elevate one portion of a region above another which usually produces the fissure. When a fault takes place it is well known that the hanging country is commonly depressed relatively to the foot wall, and a projecting edge of the hanging ground must then press and scrape against the foot wall. This wedge-like mass, not being supported at the surface by overlying rock, is greatly exposed to fracture, and will generally be more or less fissured, even when it is composed of firm material, such as granite. If ore deposition follows from solutions which reach the upper part of such fissure, the irregular cracks in the lip of the hanging country will fill with vein matter and the simple vein will be surmounted by a chamber or a series of chambers close to the surface.

If a country be composed of rock of feeble and variable tenacity, the tendency of the ground near the surface to break up into irregular fragments will be much greater than where the country is firm and homogeneous, and the formation of chambers of ore close to the original surface is the more to be expected. The ore bodies which were found near the croppings of the Comstock lode were of this description, and so are most of the superficial cinnabar deposits of California.

I propose for these irregular bodies found at the croppings of veins the name "cap chambers," to distinguish them from the lateral ore bodies of chambered veins. The term vein chamber, then, includes cap chambers as well as lateral chambers.

So far as we know anything of the mechanical conditions of ore deposition, it appears from the foregoing paragraphs that many deposits which now appear as simple fissure veins must once have included cap chambers, and must, consequently, have come under the definition which I have proposed of a chambered vein. The cap chambers in these cases must have been removed by erosion. Where ore deposition has continued until all available crevices were filled, as has sometimes but not always been the case, it is evident that cap chambers will contain a comparatively large amount of ore, often more than will be found within an equal vertical interval far from the surface, where the fissure system is more simple. Such was the case, for example, on the Comstock lode. Such also may have been the case on the gold belt of California, and the immense amount of auriferous gravel would then not represent the erosion of contracted quartz veins, such as are now being mined, but of the cap chambers of the veins. This hypothesis greatly reduces the amount of general erosion which the existence of these gravels would imply.

An Important Tunnel Decision.

(*Continued from Page 659.*)

clude a right to drive a tunnel through such a location for the purpose of discovery.

We are not aware that the precise questions presented for our determination, which we have designated as proposition second, in the former part of this opinion, have ever been passed upon by an appellate court. In the case of Stratton v. Gold Sovereign M. & T. Co., reported in Mills' Legal Adviser, 350, in which case complainant brought an action to restrain defendants from extending a tunnel through the claim of the former, which had been located prior to the date of the tunnel site, the defendants answered that they were driving such tunnel for the avowed purpose of discovering and claiming blind veins within the territory of complainant's claims. Complainant applied to Judge Hallett for a temporary injunction, which he granted, and in the course of his opinion said:

"Chapter 6 of the Revised Statutes provides for three kinds of locations on the public mineral lands, which, in common speech, are called 'lode locations,' 'tunnel locations' and 'placer locations.' When a location has been properly made in either class, and so long as it shall be fully maintained by use and enjoyment or by patent, the territory embraced in such location is not subject to adverse location by a claimant of the same class, or any other class. The reason is, that the territory covered by such location has been severed from the public domain, and has become private property, which is no longer open to a new appropriation."

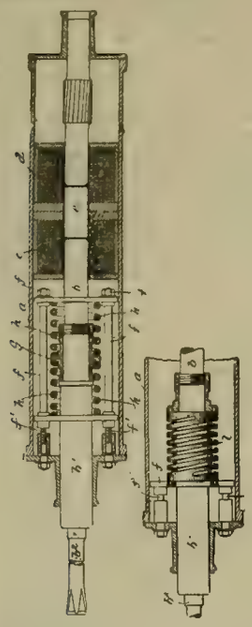
Our construction of Sec. 2323 is, that a tunnel site can only embrace unappropriated public domain, and that under it no rights are conferred to extend a tunnel, though previous valid, subsisting locations. From the record before us, appellant had no right to invade the premises of appellee, through its tunnel, and in the absence of any proof to the contrary, the presumption attaches that all veins discovered in that part of its tunnel under appellee's claims belong to the latter—Wakeman v. Norton, 24 Colo. 192—and the judgment of the court, that appellee was the owner of these veins, and enjoining appellant from further extending its tunnel into, or using that portion of it under the claims of appellee, is correct.

The final question passed upon by the trial court, under the stipulation, relates to the offer of appellant to prove that at the time of the location of its Ithica tunnel site, no ore had been discovered in the Monarch and Mammoth Pearl. This offer was denied. At the time the tunnel site was located, and work commenced thereon, receiver's receipts had been obtained for these claims, upon which patents subsequently issued. These evidences of title took effect by relation as of date of the location of the respective claims—Lindley, Sec. 783. As against a collateral attack, the action of the Land Department in issuing such patents conclusively settled that all steps necessary to constitute a valid location of these mining claims had been taken, which included the discovery of mineral. This question has been so frequently decided that we do not deem it necessary to discuss it. Lindley, Sec. 777; Davis' Admr. v. Weiboid, supra; Poire v. Wells, 6 Colo., 406; Justice M. Co. v. Lee, 21 Colo., 260; Smelting Co. v. Kemp, 104 U. S. 636; Steele v. Smeling Co., 106 U. S. 447. It is contended on behalf of appellant that this principle is not applicable as between tunnel site and lode locations, because its rights were not involved in the patent proceedings. As to inchoate rights which attach to a tunnel location, this may be true, but it had none, unless it successfully attacked the title of appellee in apt time, for the location of appellee's claims was prior to the location of the tunnel site. At the time of that location, receiver's receipt had issued upon the Mammoth Pearl and Monarch. We can not understand how, upon any possible theory, the rule announced is not applicable, as between a tunnel site location over a prior lode location, upon which a patent has already issued. So long as the title to the claim of appellee was only evidenced by receiver's receipt it was still subject to an attack in a way; but when patent finally issued upon these claims, it conclusively settled, as against the junior location, of appellant's tunnel site, that all steps necessary to constitute a valid location of appellee's claim had been taken.

Errors are assigned upon the action of the Court below, in denying appellant's petition to remove the cause to the Circuit Court of the United States for the District of Colorado. No argument is made on this assignment, and we therefore decline to consider or pass upon it.

A further error assigned and argued by appellant is, that the Court erred in overruling its motion for leave to develop the blind veins in its tunnel within the lines of appellee's claims, for the purpose of establishing their character. Its acts in attempting to initiate title to these veins was a trespass, which it was not entitled to continue under any leave of Court.

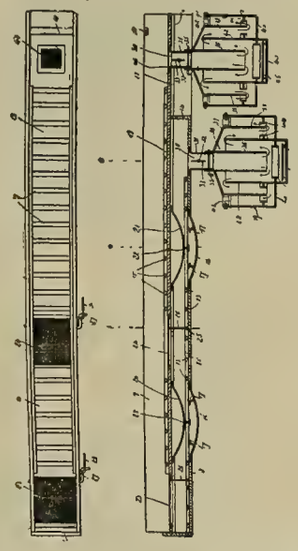
This disposes of all the questions argued, and finding no error in the record, the judgment of the District Court is affirmed.



The case will, undoubtedly, go to the highest tribunal, the Supreme Court of the United States, for final adjudication.

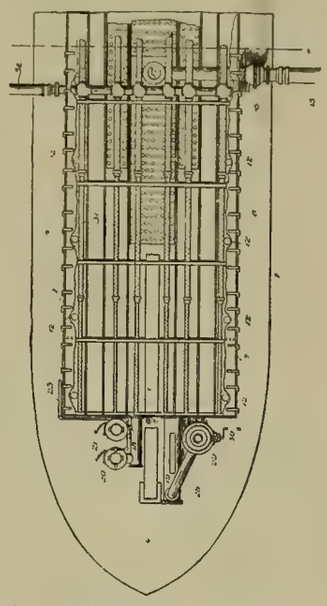
Latest Mining and Metallurgical Patents.

Patents Issued Nov. 28, 1899.



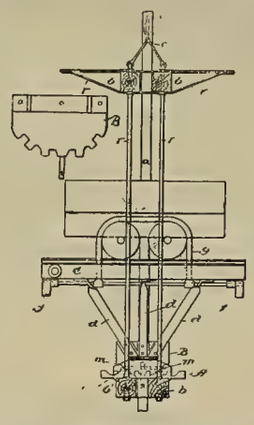
Specially Reported for the MINING AND SCIENTIFIC PRESS.

RECIPROCATING DRILL.—No. 637,809; A. E. W. Meissner, Charlottenburg, Germany.



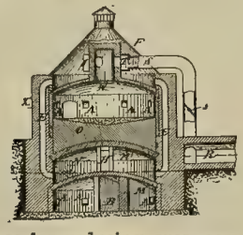
In a drill, the combination with the casing, a drill-rod, and a collar removably held by threads on the latter; of a spring adjustably connected at one end to the casing and attached at its other end to collar, and an electric motor devoid of springs and entirely independent of spring for reciprocating the drill-rod, as and for the purpose set forth. The combination with the casing, a spring-carriage therein, and threaded connections between these parts for permitting the adjustment of the carriage bodily; of a reciprocating drill rod moving through the casing and carriage, a spring attached at one end to carriage, connections between its other end and the drill rod, and means entirely independent of the spring for reciprocating rod through a predetermined path.

GOLD WASHING APPARATUS.—No. 637,861; J. H. Fellows, El Dorado, Kans.



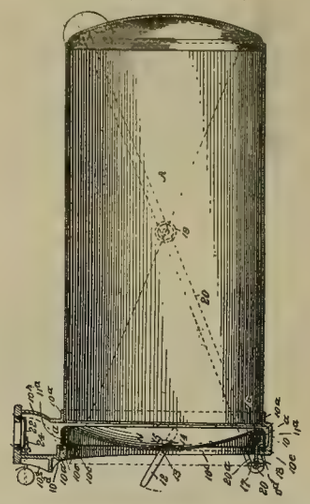
In an apparatus of the class described, a casing provided with a longitudinal perforated partition, the bottom of casing being provided with receptacles having transverse baffles and adapted to contain quicksilver, said partition being provided with transverse riffles and with deflectors adapted to operate in connection with receptacles, and provided with transverse baffles which operate in connection the baffles with which receptacles are provided; each casing provided with a sieve, and riffle bars arranged upon partition, and upon the bottom of casing, the bottom of casing and partition being provided respectively with a receptacle and a deflector, each of which is provided with baffles which co-operate to swirl a mass of water passed through apparatus. In the main casing, comprising a bottom, sides and end, bottom being turned upward at one end to form an upright transverse partition, a longitudinal perforated partition detachably mounted in casing and extending at one end beyond upright partition, gold-retaining devices connected with partition and the bottom of main casing, and comprising riffles and receptacles provided with deflectors, a supplemental casing connected with and adapted to receive auriferous water from the bottom of casing, and a supplemental casing connected with longitudinal partition at a point thereof in the portion which extends beyond upright partition, and adapted to receive auriferous water therefrom.

METHOD OF DISPOSING OF DREDGINGS.—No. 638,145; A. G. Rose, New York, N. Y.



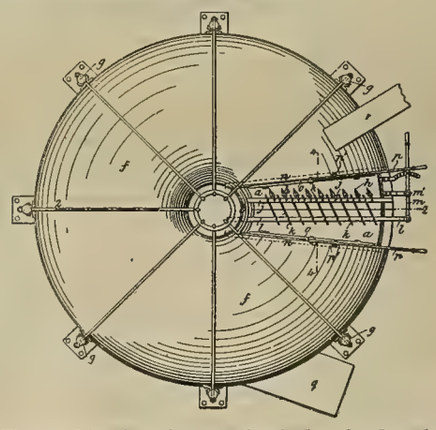
The method of disposing of dredgings which consists in keeping them confined from exposure to the open atmosphere, delivering them into the interior of an air-tight compartment, purifying the air expelled by the influx of dredgings, from the compartment, and finally discharging the dredgings from the compartment without exposure to the atmosphere.

DUMPING CAGE.—No. 638,114; W. G. Halbert, Westville, Ill.



A tilting cage provided with a pivotal platform, platform being sustained by toothed rocker members, mounted on stationary toothed castings, that are axially ranged in a line vertically coincident with the center of gravity of platform, toothed members being slightly flattened on their bearing-faces to provide a suitable base. A tilting cage provided with a pivotal platform, that is sustained by toothed rocker members mounted on stationary toothed castings, members being axially ranged relatively to platform and provided with limiting stop pins.

FURNACE FOR REDUCING ORES.—No. 639,099; L. Correa, La Felguera, Spain.



A gas furnace for reducing ores, comprising four superposed chambers, namely, an air receiving chamber, next below this air receiving chamber, a smelting chamber having a hearth, and a burner for gas and air in its upper part, next below the smelting chamber, a hot air chamber, connected by flues with the air-receiving chamber and with burner, and next below the hot air chamber a fume chamber connected with the smelting chamber and with the fume outlet. A gas furnace for reducing the ores on a hearth, comprising a smelting chamber *W*, with a hearth, an air heating chamber *N*, next below the chamber *W*, a fume chamber *M*, next below the chamber *N*, and connecting with the smelting chamber and the fume outlet, and a burner *K*, open to the upper part of the smelting chamber, furnace having also an air-space above the smelting chamber, air flues connecting space with the chamber *N*, and a hot air pipe *I*, connecting chamber *N* with the burner *K*.

RETORT DOOR AND MEANS FOR CLOSING SAME.—No. 638,122; J. B. Houston, Vancouver, Canada.

In a door of the class described, in combination; a frame 10 secured to the mouth of the vessel to be closed, a passageway for a door downward through frame, and a flexible seat arranged around the opening to be closed and designed to receive the rim of the door, hand levers 12 having devices thereon for drawing the door to its seat, and balance levers for raising door, a flap-door for closing the opening through which the main door slides when being opened, fulcra arranged to support flap and levers and weights for balancing the same and for bringing it to its seat. Means for closing the door, a vertical passageway for a door through the upper part of the frame, a rim carrying a packing forming a seat around the opening to be closed, a door arranged to be placed over seat and levers for raising and lowering the same, and means for drawing door on to its seat when closed, a flap-door for closing the passageway hinged or supported on fulcra, passing through glands on the opposite sides to the exterior of the frame 10, and levers and balance mechanism fixed on fulcra, and means for allowing the door to be pushed tight against its seat by the internal pressure.

CALCINING FURNACE.—No. 637,864; J. Godfery and H. J. Hayes, Swansea, England.

The combination of a rotating bed, a fixed roof in the form of a segment of a circle, leaving an opening in the roof, partitions along the radial sides of the opening in the roof, plows between the partitions below the opening and means for rotating the bed beneath the plows, the organization being such that the material is alternately heated and exposed to air out of contact with the products of combustion, and the plows are protected against undue heat. Devices extending to the outside of the furnace for adjusting the distances of the bottoms of the partitions from the bed, two sets of plows between the partitions below the opening, one fixed and the other pivoted, and means extending to the outside of the furnace for simultaneously adjusting the angle of the pivoted plows to the direction of motion of the bed.

Blasting by Electricity.*

By CLAUDE H. SMITH.

In taking this subject for discussion, I will confine myself of necessity to merely the applications of electricity to methods of discharging the ordinary explosives in use to-day; for, while experiments have been and probably are being conducted to-day for finding some compound which would explode only by the action of the electric current, I am not aware of the successful ending of any of these experiments. Their object is a worthy one, for such an ideal explosive would indeed minimize the dangers in rock working, and it is to be hoped that they may result in some practical discoveries ere long.

It is probably well at this point to describe briefly the essential piece of apparatus in the whole system, which of course is the electric fuse. It is of practically the same pattern in all makes, and the principle of action may be said to be exactly the same in all makes used in this country. In appearance the electric fuse might readily be taken at first glance to be an ordinary cap with fuse attached ready for insertion into the stick of powder; and indeed it consists of practically the same relative parts and is inserted into the powder in the same manner.

The copper shell is about the same size as the ordinary cap. The shell is about two-thirds full of detonating material. Two copper wires of about twenty gauge with a strip of platinum soldered across their ends extend a short distance from a cement plug which rests on the explosive material, and are thus imbedded in the explosive. This cement plug also serves to make the shell waterproof.

The passing of a sufficient current through the circuit will cause the highly resisting platinum wire to rise in temperature to at least a red heat, thus igniting the explosive material, which, in turn, by its detonation, explodes the charge in which the fuse is inserted. The wires are insulated by waterproof material, so that the entire fuse is waterproof and can be used in wet holes and even for a "water-shot," if desired, without further precautions. This is one of the points in favor of its use.

The machines for generating the current to be led to the shot holes have been various, but at present are nearly all of one practical type. A description of the general principles of these current generators, which are commonly called "blasting machines," may be of interest here.

They are a special type of the magnetic electric machine seen in the ordinary telephone set, being much larger and wound to deliver a much stronger current. The most common form used is enclosed in a tight box convenient for carrying. The mechanism for rotating the armature is so arranged that a current is short circuited until near the end of the stroke, when the short circuit is broken and the current sent out on the line at its maximum strength, thus insuring the simultaneous firing of all the fuses. If this scheme of sending out only the strongest current through the fuses was not employed, but the current allowed to enter the series of fuses from the starting of the current, the current would gradually rise in power until it was sufficient to fire the first two or three fuses in the series, when their explosion would break the circuit and the balance would have to be connected up again before their discharge could be accomplished, and even then probably not all the remainder would be fired in the next attempt. Thus one of the principal features, viz: the simultaneous discharge, would be lost. The shots are always connected up and discharged in series, for the difficulties in obtaining a uniform current through each fuse, thus insuring the discharge of all, are not offered in that method, which are present in the multiple method. The latter method requires each loop of the circuit to have very close to the same resistance, in order to receive an equal share of the current. This would require, first, great uniformity in making the fuses, and, further, calculating care in connecting up the shots at each blast, which would be a useless waste of time since the series method is available.

Having described briefly the way the various parts of the system perform their functions, it remains to discuss the advantages and disadvantages possessed by the system.

There are several precautions which are almost imperative to the proper working of the system. The lead wires should be frequently inspected and tested for imperfect insulation, through which the high voltage current would rapidly leak when touching the wet mine walls, thus possibly preventing the discharge of any of the shots. All connections between fuses and connecting wires must be well taped to prevent leakage to the earth, which might drop the current enough to prevent the explosion of the balance of the series. The circuit of each fuse should be tested before using, and the whole circuit, when ready to fire, should be tested by a low current to ascertain the existence of faulty connections. The blasting machine should be tested before each blast to prove its current to be full strength.

In order for the system to be an ideal one, it is necessary to assume that the best results from a series of shots is always obtained by a simultaneous discharge. But if in the same set of shots some are required to be discharged before the others, a third wire at least would be required in order to divide the shots, and the odds are very high that the flying rocks from the first discharge would break some of the remaining connections and a loss of time would ensue before the connections could be again made, owing to the necessity of waiting some time for the powder smoke to disseminate. But in the large majority of cases it is true that a simultaneous discharge gives the better result, and, rather than condemn the system on this one point, it would seem more logical to have common fuse and caps handy to use in such special cases, cutting the level out of the circuit for that particular instance. However, this case might arise so frequently in some kinds of rock that the usefulnsss of the system would be almost destroyed.

Another feature of the system would seem to overbalance the extra precautions belonging to it as heretofore mentioned; and that is the element of safety, as every man can be totally out of danger before the blasting takes place.

Again, in a well established mine the dangers to the circuit mentioned can be reduced to a minimum by stringing permanent okonite or other well insulated and waterproof wire in the different tunnels, levels and shafts, so that only the connecting wires to the fuses need be exposed to the possibility of leakage.

Lastly, owing to the detonation of these fuses being much greater than the ordinary caps, more work is gotten out of the same amount of powder; and, further, as much more and cleaner work is done in most cases by the same shots simultaneously discharged, than if in succession, the vantage for economy for work done would seem to be on the side of electricity. For, after the first cost for machine and lead wires, the fuses and small amount of connecting wire needed, cost but a trifle, if any, more than the fuse and caps of the old system, and are subject to practically no waste, which cannot be said of the old system.

While it is not wise to draw theoretical conclusions in a limited discussion like this, still my conclusion that electric blasting apparatus has the advantage in its favor, seems to be upheld in the fact that the system is in such general use throughout the country and rapidly replacing the old system.

*From a paper read before the Technical and Engineering Society of Golden, Colo.

SALT WORKS, CARMEN ISLAND, LOWER CALIFORNIA.

The Islands of Lower California.

Along the coast line of Lower California, both on the Pacific and Gulf sides, are numerous groups of islands. Some of these are large, others are small. Many of them are valuable for their mineral and other resources. On Cedros Island are mines of gold, silver and copper. San Jose island, forty miles northwest of La Paz, is twenty-one miles long and ten miles wide. The inhabitants are engaged in cattle raising and salt manufacture. There are also large deposits of marble and gypsum on this island, but they are undeveloped. In 1881 a vein of gold and silver ore was discovered, which was profitably worked for five years.

On Catalina island, eighty miles northwest of La Paz, there are undeveloped silver veins. There are on this island, as on a number of others along the coast, valuable pearl fisheries.

Carmen island is 125 miles northwest of La Paz. It is 130 miles long and eight miles wide. On this island are large deposits of salt, which are worked throughout the year, giving employment to a large number of men. There are said to be rich deposits of gold and copper on this island also, but they, like the others, are undeveloped.

The accompanying engraving from J. R. Southworth's *Lower California Illustrated* shows the extent and character of the salt lands of Carmen island.

Phenomena Attending the Accumulations of Bitumen.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER, State Mineralogist of California.

Water.—Through its inferior gravity petroleum oil ascends through water from the depths of the earth and either forms bituminous springs upon the surface of the earth, or by its buoyancy floats upon the water and is stored in the uppper parts of porous or seamed strata. The movement of subterranean water is indicative of the movement of oil. Besides these offices, the influence which thermal waters holding silica and other minerals in solution have exerted in many rocks is a question closely connected with the accumulations of the bitumens. All deposi s precipitated from water, lime, silica, etc., may become the cementing substance of shale or sandstone; and, again, all substances cementing or composing rocks which are soluble in water are liable to be leached from the rocks by percolating water. There may be mineral springs without the presence of bitumen, but there are no springs of bitumen that are not accompanied by mineral waters.

Southwest of the metamorphic rock are sandstone strata and farther to the southwest is shale. The sandstone where it adjoins the serpentine is snow white. Hot alkaline and acid waters entered these shales and sandstones and dissolved the bases contained in them, also dissolving a quantity of silica. These waters cooled as they neared the surface. The silica would have been deposited had these waters not encountered a flow of meteoric water, which greatly diluted the hot solution. This increased volume of water made it possible for the silica and bases to be held in solution and be carried away to the sea.

FIG. 4.—CONTACT OF LEACHED SANDSTONES AND SERPENTINE

The shales become darker as they go from the altered rocks until they finally become the color of normal shale. In places these leached shales have a width exceeding one mile.

The arrows in the sectional views indicate the direction in which the water flowed and the general direction in which it now flows. The geographical configuration of the country shows that the waters flowed in this direction, as higher mountains lie to the north of the formation shown in the sectional views.

The finding of bitumen in the southern dip and the absence of the same from the northern dip of the anticline shown in section *C D* is additional proof that waters flowed in the direction shown by the arrows. (See Fig. 2.)

Near the serpentine all fossil shells are removed by the solvent action of mineral waters from the shales and sandstones, and the casts and molds are obliterated through the incoherency of said sandstones and shales, and also by the removal of the coloring from the darker material that usually replaces the part formerly occupied by the shell. At a distance of 1000 feet or more from the serpentine the same stratum that adjoins the metamorphic rocks contains casts and molds of fossil shells, while still farther away fossil shells exist.

The whitened shales have a porous structure and are very light compared with normal shales. They can be easily ground between the fingers, owing to the removal of soluble material which once occupied the pores.

Shales and sandstones leached of all bases, such as lime, magnesia, metals, etc., are but slightly coherent and are easily eroded.

Jaspers.—The metamorphic rocks shown in the sketch consist principally of jaspers, or shales, and sandstones partly converted to jaspers. They have a hardness of 7 and a specific gravity of 2 55, and break with a conchoidal fracture. Their prevalent colors are yellow and brownish red of various shades, sometimes nearly black in the seams and sometimes a greenish white.

The darker jaspers often have a resinous luster, but are generally dull.

The transition from shale to jasper is plainly visible; all gradations from unaltered shale to jasper will occur within a distance of a few feet. A portion of the jaspers retains the form of shales, with the exception that they are contracted and distorted by heat. Sometimes they are burned so as to form a solid mass.

After burning, they have been silicified with amorphous silica, filling minute cracks and spaces in the jaspers.

The brownish red jaspers show unmistakable signs of having been burned. They are warped, contracted, broken and vesicular, showing all the structural conditions that shale does when artificially burned in large masses.

The whitish green jasper does not show all these signs of burning, even when in immediate contact with the brownish red jaspers; but the shales, between which and the brownish red jaspers these whitish green jaspers lie, are contorted by heat, and next to the whitish green jaspers are discolored by oxide of iron.

FIG. 5.—OPEN SEAMS AT RIGHT ANGLES TO PLANES OF BEDDING.

The vesicular condition only occurs when the brownish red shales are apparently greatly burned.

In places these brownish red jaspers closely resemble the jaspers that are the most burned and which are produced by chemical heat near the surface of the earth, and probably are produced by the same metamorphic actions, but on a greater scale.

Pockets containing burned shales not exceeding 8 inches in diameter are found in unaltered shales near the surface which closely resemble some of the jaspers that are in the large mass of metamorphic rocks shown in the sketch.

It might be expected that, through metamorphic agencies, jaspers might be formed in a large space, but it is remarkable that they can be formed in a space 6 inches in diameter.

Overlying the serpentine and jaspers at *J* (See Fig. 2) are chemically burned shales; these burned and red shales are fully described in a former article.

In Santa Barbara county these red shales cover a large area.

Frequently in the jaspers seams and cracks approaching horizontally are closed, while those approaching vertically are open to the extent of the contraction of the rocks during burning. (See Figs. 5 and 6.) The closing of the horizontal cracks and seams may be due to the weight of the metamorphosed rocks, but it must have been augmented by superincumbent strata. The opening of the vertical seams and cracks must have occurred at the time they were metamorphosed, showing that there was no great lateral pressure on the rocks during or since their change.

FIG. 6.—OPEN SEAMS WITH PLANES OF BEDDING.

The open cracks and seams are either with, or at right angles with, the plane of bedding of the rocks. When the plane of bedding is nearly horizontal the open cracks are nearly vertical; when the plane of bedding is nearly vertical the open cracks are along the plane of bedding.

There are three important changes during the production of jasper, or chert, from shale, viz: leaching, baking or burning, and silicification, and these changes occur in the order given above.

The leaching of lime, magnesia and other bases by percolating hot waters leaves a light and porous rock, consisting principally of insoluble silica and alumina.

The porous condition of the rock permits the circulation of heat and hot gases; this circulation of heat and gases is also aided by the breaking of the formation through subsidence.

When burnt by chemical fires these shales are of many shades of pink, red, reddish brown, white and yellowish white, and are sometimes black, this color being caused by the presence of carbonaceous matter. Some of these shales are fused and are of a brownish red to black; by fusion they became impervious to fluids, while the remainder of the shales remain more or less porous.

Besides the cracks caused by earth movements there are numerous small cracks caused by the burning and breaking.

One layer of jasper is a bad misfit with the adjoining layer. Sometimes a piece of a layer of jasper a few inches in length will be warped in one direction, whereas an adjoining piece of a layer will be warped in a contrary direction; some are acutely bent, but the layers of jasper seldom fit perfectly with one another. Nothing but baking and burning could create this almost universal misfit in the layers.

After the jaspers are hardened they cannot be contorted and bent. They would break before bending, and if they were contorted and twisted when in a plastic condition they would probably exhibit slickensides and would have but few wide seams and seams of irregular width and would not be vesicular.

No slickensides are to be seen between the layers, the surface of these layers being nearly always rough. The greatly contorted, bent and roughly seamed condition of the jaspers must have been occasioned by heat which baked, burned, fused, contorted, cracked, warped and hardened them and made them vesicular.

Subsequently to their burning the small vesicles and cracks in them were filled with chalcedonic silica. On account of their burning and silicification they greatly resist weathering.

Subsequent to their leaching, burning and baking, in some of these burned shales the vesicles produced by fusion and the small cracks and pores and numerous minute round and oval areas have been filled with soluble silica deposited from circulating siliceous waters, forming jaspers and cherts.

These spaces are usually filled with silica which has a different color from the ground mass of the rock, the colors usually being white and of various shades of red or brownish red.

Sometimes these interspaces have been filled with bands of different colored soluble silica, the bands running parallel with the walls of the spaces.

The interstices in the strata of sandstone shown in section *E F* have been filled with soluble silica, making a hard, compact rock; whereas the same strata a short distance to the east and west consists of sand cemented with bitumen.

(To be Continued.)

The Divining Rod in Arizona.

TO THE EDITOR:—I have been treated to an exhibition of a new divining mineral rod by one who claims to have made a valuable discovery. I was conducted by the discoverer, an old man, to a barn on Sunday morning and shown a porous reed 3 feet long and as large as a pipe stem, and also a vial containing the secret combination of magical minerals which weighed about two ounces. This vial was tied to one end of the wand by a silk thread (the said silk was indispensable). Then he began prospecting for gold by putting a $20 piece in his mouth and taking hold of the end of the wand by both hands. It begun to rise with the vial attached at the other end until it stood straight up in the air. He then proceeded to prospect for copper by placing a copper cent in his mouth, in place of the gold piece removed, and standing to the east he again took the wand between his hands, when it commenced to rise over his head and pointed to the Old Dominion properties, situated due west. How it was done I am unable to say. The old man says he can find oil in the same way and says that it can be found within six miles of here. He wanted to organize a company, but I did not invest.

Globe, Arizona, Nov. 20th, '99.

A Wolframite Mine.

The Durango mine at Lead City, South Dakota, was originally located in 1876 for gold, the claim containing an extension of the noted conglomerate deposit which to the northeastward of the Homestake vein was rich in gold in a score of mines. As a conglomerate mine the Durango was not a success; the encroaching Cambrian sea piled up on that ancient beach heaps of cobbles, gravel and sand, but little gold, the source of supply, the Homestake system of veins, having been covered before the shore deposit

had reached the Durango. For years the mine laid in idleness, but recently it has developed a new source of wealth in deposits of wolframite (iron tungstate). Several shoots of this ore occur lying in the upper portion of the Cambrian quartzite, or just above it, the quartzite overlying the conglomerate bed. The wolframite is 14 to 18 inches thick and several carloads of the mineral have been shipped to Eastern steel manufacturers at good profit. The ore runs 40% to 55% iron tungstate. Otto Grantz, whose Hidden Fortune mine has made him suddenly rich, discovered the gold in his claim while prospecting for wolframite, where the mineral is also found. The quartzite contains gold associated with tellurium. These ore deposits have been formed in close proximity to dykes intruded from below, coming up through the underlying schists and intersecting the conglomerates, quartzites and overlying formations.

Motive Power at the Mines.

NUMBER IV—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by A. E. CHODZKO.

A few figures concerning the cost of operating a mining plant of a definite size by means of oil engines may prove of interest, as enabling its owner to establish a comparison with his present running expenses.

The distance of the mine from the nearest place where carload consignments of oil can conveniently be shipped and the means of conveyance therefrom are the first important points, which, when settled, will decide whether the use of this class of motors is to be considered at all; and when this subject is given close attention it seems reasonably safe to assert that in almost every possible instance this distance need not be considerable.

It must be remembered that a large mine situated very far from the railroad is in exceptional conditions in this respect; for if its location is particularly difficult of access, high-grade ore in large quantities will be the first requisite to justify the development of the property and the creation of a convenient power plant to operate it. When this point has been satisfactorily established, the question of first expenditure incurred in securing a steady supply of motive power becomes a side issue, even though this outlay may represent a large amount of money.

There has been occasion to state in the course of this article that such a concern will generally not depend upon a custom power plant, but will find it to its advantage to erect and to maintain its own power generating outfit.

So that if the possibilities in the way of steam or water power are found to be inadequate this company can afford, if need be, to establish a private oil pipe line of great length, even should two or more pumping stations have to be built alongside of it; or else, if the laying of pipes is for some reason objectionable, over a rugged country, a long distance ropeway may answer the same purpose.

Setting aside, therefore, the case of a large company, and directing our attention to a mine of moderate size, many miles away from the railroad—since no difficulty is to be overcome at a moderate distance, as is the case with a majority of the mines on the mother lode of California—we only can possibly be confronted by one of two things: either the mine is far up in the mountains, where timber and water are plentiful, and there is no use for an emergency plant, or else, as in southern California, Nevada, Arizona and Austra ia, long stretches of arid and comparatively level plains extend between the railroad and the mine. In such regions traction steam or oil engines have long since proved to be the very thing for hauling freight trains of carts with supplies of all kinds, which will most readily take in tow one or more oil tanks.

And, then, we must remember that there is no panacea that will cure all diseases. In some cases either because of high freight rates or for other reasons the oil supply cannot be secured with economy, and the conclusion is simply that something else has to be done.

Conditions not exceptional along the mother lode would obtain in a mine where hoisting has to be done from a shaft not over 1000 feet of vertical depth to supply a 10-stamp mill with rock breaker and four vanners.

An underground pump of the non-compound direct-acting type has to handle a maximum of 50,000 gallons in twelve hours, and air at seventy pounds gauge pressure, without reheating, is supplied to it by a compressor which operates three 3½-inch rock drills during the remainder of the time.

It is assumed that the working conditions are such that an oil engine can safely operate the hoist in the ordinary way, namely, by belting on a countershaft otherwise actuated by water or electric power.

The amount of crude oil required for the operation of this mine will now be estimated, and its cost based upon figures obtainable in California in the fall of 1898, when a special investigation was made by the writer of the cost of power from various sources, in a mining region located from twelve to fourteen miles from rail. Hauling over that distance has been assumed to be effected by means of teams, which would be more expensive than in the way previously suggested.

No comparison will be made with the cost of water and electric power in the same section, the interested reader being left to draw his own conclusions in this respect.

Without entering into useless details, a safe estimate of the required power would be:

Mill	30 H. P.
Hoist	10 H. P.
The volume of free air to be compressed per minute when pumping at the maximum capacity would be, twelve hours	480 cu ft.
The volume of free air required by the drills, supposed working together during twelve hours, which is also an extreme case, would be	240 cu. ft.
Giving an average of	360 cu. ft.
And assuming a mechanical efficiency of 0.8 for the compressor and an additional loss of 10% in the belting, the average brake H. P. of the motor must be	75 H. P.
Making a total of	115 H. P.

The oil consumption, at the rate of 0.8 pint or 0.1 gallon per brake H. P. per hour is, therefore, per twenty-four hours: $11.5 \times 24 = 276$ gallons, or 6.57 barrels, a day, so that a 54-inch by 16-foot plain cylindrical tank, of the size of a standard 70 H. P. boiler, would hold a week's supply of oil with continuous run at maximum capacity. As a passing remark, it might be stated that a cemented tank of masonry would be very convenient for that purpose, inexpensive to build, and easier to clean than a wrought iron tank.

The cost of oil, including haulage, was estimated at 5 8 cents per gallon, representing a daily cost of $16. The attendance would be the same as with the present motors, the oil engines being provided with very sensitive governors, and the pipe connections with the tank requiring no more care, and probably less, than water pipes under heavy pressure.

In the particular case considered it would be advisable, in order to work under the best economical conditions, to have three 30 H. P. motors—which in practice easily develop 35 H. P.—namely, one at the mill and two at the compressor, one of the latter working during half of the time, and then one 10 H. P. motor for the hoist, which could be stopped during the intervals between lifts, owing to the moderate capacity of the mill, thus reducing the slight oil consumption incurred when the engine is kept in constant motion without doing work. It must be understood that the figure here given of 10 H. P. would cover all the requirements of the mill supply and also of hoisting waste or timbers; it is likely, however, that in a mine like the one described, a somewhat larger hoist, say 15 H. P. or even 20 H. P., would be used intermittently. But what is here desired is the actual work, so as to arrive at the oil consumption.

These figures will suffice to give a fair idea of the results to be expected from a plant of this description. A precise estimate would require, in each particular case, a special consideration of the altitude, the above figures being given at sea level, for the sake of simplicity.

It is now in order to briefly substantiate a previous statement, to the effect that the use of compressed air in a hoist instead of the immediate action of an oil engine, while introducing an apparent increase of complication, was not really a cause of reduced efficiency.

It is almost obvious that this higher degree of safety and of elasticity of motion would hardly be justifiable in a case like the one just considered, where less than two tons of ore are to be raised per hour.

We will, therefore, cons der a hoist developing 50 H. P. effective, and built on the direct-acting Corliss type, with compound cylinders, single pipe system, the air being reheated to 300° Fahr. prior to entering the high power cylinder, and also on its passage from this one to the low power cylinder, expansion practically complete, with seventy pounds initial pressure and two pounds terminal, both effective.

To operate such a hoist will require the compression of 444 cubic feet of free air per minute, and the motor actuating the two-stage compound compressor will have an effective horse power of 76, showing an efficiency of 0.65, between motor and hoisting work performed, which is likely as well as could be done with a first-class geared hoist directly operated by an oil engine.

In concluding this already too long paper the writer may be permitted to express the hope that the preceding remarks will prove useful to some, at least, of the mine owners who have been depending, for the operation of their properties, on natural resources, which were almost unconsciously considered as unvarying and inexhaustible. It is a happy circumstance, indeed, when the remedy is found side by side with the evil which it has to cure, and in few cases would its application be easier and safer than in the present occurrence.

LARGE deposits of corundum have recently been discovered in the district of Carlow, Ont., which are to be worked by a syndicate of American and Canadian capitalists. The corundum is to be used in a variety of ways for abrasive purposes, and it is believed that aluminum can be produced from it cheaper than from any other source. The syndicate has leased 1200 acres of corundum lands from the Ontario Government, and has agreed to expend before 1902 not less than $100,000 in opening the deposits and in the erection of machinery.

Winter Navigation on the Great Lakes.

In view of the difficulty in shipping sufficient iron ore from the Lake Superior ports during the summer season, an effort is to be made to keep a channel open through winter. Concerning this the *American Manufacturer* says:

It is believed in many quarters that the first step toward ultimate all-year navigation of the great lakes has been taken, and will be experienced the coming winter in slight measure at least. The Great Lakes Towing Co. is having a powerful tug built at the Davidson yards designed to break 12 inches of blue ice at the rate of six or seven miles an hour. It is the intention of the towing company to put the new tug in operation on the Sault river during the closing days of the season if there is any necessity for her before the boats quit running. Agitation of the subject of all-year navigation on the great lakes has been started as a result of the extremely big volume of freight in both directions this season. But there seems to be a question whether winter navigation would be practicable if anything like the range of rates that has prevailed during the biggest part of this season is required to make it profitable. Even now, and for two or three months past, the rates via the lakes has been so high that grain has been diverted to the all-rail routes to the seaboard. The same is true of lumber. This commodity is now going to New York and other Eastern points all-rail. There is a growing belief, however, that the all-year navigation of the lakes is bound to come, and in the very near future. It is said that the growing demands of the Northwest are beginning to demand it. It would be comparatively easy, in times of high freights like the present, for the vessel interests to stand an additional cost that would likely be incurred in keeping the harbors and connecting waters open for at least thirty days on the end of the season. It is said that the open season of navigation can be extended to nine months a year at least by the use of a few first-class ice-breaking tugs heavy enough to stand the work of going through ice a foot thick. It is pointed out by a vessel man that the ice will not have a chance to form very quickly if the boats keep moving over the same channels frequently.

Starting a Blast Furnace.

Few people who have not actually run a blast furnace realize what it means to fill the capacious maw of one of those monsters. A stack of 200 tons daily capacity, running on 50% ore, must have delivered to it each day something more than 400 tons of ore, 250 to 300 tons of coke and over 100 tons of limestone, besides sand, coal and minor supplies—say 900 tons raw material. Add the 200 tons of pig iron product shipped out, and we have a daily freight movement of 1100 tons, taking no note of the disposition of the slag. The mining of the ore requires the labor of 150 to 300 men, the coal mining, coke making, quarrying of limestone and transportation at least 300 more. The furnace itself employs about 150 or more hands. Starting up a furnace of ordinary capacity, therefore, calls immediately for the labor of nearly 1000 men; for the use of at least 1000 railway cars and many locomotives; for perhaps several steamers and vessels on the lakes; for capital, from the mines to the pig iron, of one million to two millions of dollars and last, but not least, for a high order of managing ability.—Engineering Magazine.

Too Much Gold.

The following interesting statement appears in a technical paper on the mining regions of Peru, by Senor Manuel Elguera. The method employed is wholly novel and either the results or the wants of the operators are unusual:

In the north of Peru, about two years ago, I crossed the Maranon, the Chinchipe and other rivers, and gold is found in every one. In many of these the Indians have what they call a farm, which is made by paving the river banks with stones, and then leaving it till the next rainy season is over, when they return to these farms and remove the stones, washing the earth which has deposited itself in the crevices between the stones, and, by the aid of mercury, they collect the gold they need, and many of them throw the gold they do not need to carry back into the river.

LONG years of active life in the mines does not insure against the liability to accident. As a matter of fact, many old miners are injured or killed where novices would escape unharmed. Constant familiarity with danger has a tendency to make miners take unnecessary risks, with often fatal consequences.

Mining Summary.

ALASKA.

In the Ketchikan district, Gravina island, arrangements have been made by a number of companies to continue work during winter. Among them are W. H. Gilmore & Co., Deer Park and the Rossland M. Co. The latter company is putting in a steam hoist on the Dall property. They are down 55 feet and at 100 feet will crosscut. They are taking out copper ore, and are on the south end of Gravina island, six miles from Metlakahtla. Gilmore & Co. will begin work with two shifts and will keep it up all winter. They are one mile from Seal bay.

On Prince of Wales island the Lichtenstater mines, consisting of fifteen claims, have a large body of copper ore which is developed superficially.

On the Copper Queen, on Kassan bay, the owners are sinking a shaft and will operate all winter.

At Helm bay, Dyer & Johnson are building a 5-stamp mill. They are in 160 feet and have been taking out rich ore.

A strike is reported at Cape Camani, Cleveland peninsula, five miles from Helm bay.

At the Sea Level mine another body of ore has been found.

On Dall island, south end of Prince of Wales, E. E Wyman and partner are operating and report that they have struck high-grade copper ore. They have been at work all summer.

The new part of Ketchikan is building up and joining the old part. Thirty new buildings have gone up in the last month.

ARIZONA.

COCHISE COUNTY.

The Commonwealth mine at Pearce is running twenty stamps and two pulverizers. An addition of thirty stamps to the plant is about completed, which will give a daily capacity of 200 tons. Steam power, generated by coal, is used. Formerly the higher grade ore was shipped but the practise was discontinued some months ago, and hereafter all ores will be treated at the works. This mine was bought by R. A. F. Penrose for himself and friends, for $275,000, when the mine was in the prospective stage. The mine returned to the investors considerably above this sum within the first three months, without any outlay for machinery other than an inexpensive whim. Since then it has produced a very large amount. Mr. Penrose made an exhaustive geological report on the Cripple Creek district for the United States Geological Survey, and recognized the great value in the Commonwealth mine when a mere prospect.

GRAHAM COUNTY.

(Special Correspondence.)—From Globe to Clifton and Morenci, the Gila Valley, Globe & Northern Railway passes through the Gila valley. Although but twenty years old, the Gila valley is a prosperous farming district by reason of its irrigating canals and such markets as only live mining camps afford. Ranchmen live in handsome brick houses, and every village boasts a brick schoolhouse costing from $5000 to $10,000. The towns of Geronimo, Fort Thomas, Pima, Central, Thatcher, Safford and Solomonville are all prosperous, owing to the demand for productions of the valley at Globe, Clifton, Morenci and the new mines being opened on the San Carlos strip, the Graham mountains on the west and the Lone Star district on the east.

Clifton is the oldest and still one of the best copper mining districts in Arizona. The Gila river flows down through the canyon between immense cliffs, from which the town took its name. It is built upon both banks of the river and is connected by a wire suspension bridge for foot passengers.

The copper mines near here were discovered in 1872 by prospectors from Silver City, New Mexico. The Longfellow was the richest mine discovered, and it, together with some other properties, was subsequently sold to Lesinsky Bros., merchants at Silver City, who built the first furnace (made of adobe) and produced the first black copper made in Arizona. The ore, being self-fluxing, required nothing but fuel and blast. The copper was shipped by teams to Las Cruces, New Mexico, 600 miles, at that time the nearest railroad connection. It was no unusual thing for teams and drivers never to be heard of again, being raided by Apaches. It was here that the first tramway was built in Arizona, connecting Clifton with the Longfellow, and subsequently with Morenci. Its gauge is 20 inches.

In 1882 Messrs. Lesinsky sold their property to the present company, known as the Arizona Copper Co. and composed of Scotch capitalists. This company began the construction of a narrow gauge railway, which is seventy-one miles in length.

In the meantime water jacket furnaces had been constructed to treat the rich ores found in the limestone contacts, but made no provision for treatment of the low-grade ores, of which there were great quantities. The low price of copper and the exhaustion of the high-grade ore resulted in the building of a leaching plant in 1894, which was designed and perfected by James Colquhoun, the manager of the company. The process is secret, but a success. Every day, except when shut down for repairs, this plant treats 150 tons of tailings. This company also manufactures bluestone and sulphuric acid directly from the sulphide ores.

The mines of the company, which are from four to ten miles from the plant, contain ores which vary so much in character that different methods of treatment are employed. In addition to the leaching process a concentrator with a capacity of 450 tons per day is in operation, and the foundation for another concentrating plant is being laid. A Huntington mill, Frue vanners and Wilfley concentrating tables are also in use. Gas engines with a capacity of 600 to 700 H. P. furnish the power for the Bessemer plant and other machinery.

A large chimney or pipe is to be constructed up the mountain side to catch the small percentage of metal escaping in fumes, and the tailings which were obstructing the river are to be elevated and flumed farther down the stream. The altitude of Clifton is 3400 feet, the mines are 6000 to 7000 feet above the sea, the ore coming down a gravity tramway. While the low-grade ores yield only a little over 3% copper, the output at present approximates 1000 tons of metallic copper per month.

At Morenci, seven miles away, are the mines of the Arizona Copper Co. and also those of the Detroit Copper Co., owned by Phelps, Dodge & Co. of New York, and of which Prof. James Douglas is president.

Here a new concentrating plant with a capacity of 500 tons per day is nearing completion and will be in operation by Jan. 1st next. It is being built by the Detroit Copper Co., being the largest in the Southwest. Under its roof is machinery from San Francisco, Denver, Chicago and Pittsburg, and some built in England. There are thirty-two jigs and twenty-eight 6-foot vanners. It is constructed in such manner as to permit one-half of it to be shut down while the other half is running. The pump will bring the water from six miles away and lift 1400 gallons per minute to an elevation of 1500 feet. Below the mill tanks have been constructed to catch the waste water, which, after settling, is again pumped to the top of the mill and reused. G. E. Hunt is superintendent of construction of this new mill. When completed it will have cost $90,000.

The Markeen Copper Co., owned by New York capitalists and superintended by Leopold Balbach, is opening a promising copper property near the old Copper King.

Clifton, Nov. 29th, '99.

MOJAVE COUNTY.

The Tennessee mine at Chloride has 6 feet of 100 ounce silver ore.

In the course of development work on the Midnight mine at Chloride rich gold and silver ore is being found.

YAVAPAI COUNTY.

(Special Correspondence).—The American group of gold mines on a tributary of Castle creek, five miles southeast of the Ryland mine, is being worked by Eastern people under the management of Dr. Ford of Phœnix.

Col. Christie is in charge of the Whipsaw group on the west side of Castle creek, near the American group. Thomas Farish, who is interested in this property, says the company contemplates putting in a smelter.

The Mammoth group, formerly owned by Robert Groom, and the Swallow, at the head of Buzzard Roost gulch, the latter owned by Duncan & Heisey, of Pittsburg, Pa., and managed by Mr. Large, are also working.

K. Barrett is operating a mine in Buzzard Roost, a few miles west of the American mines.

Briggs, Ariz., Nov. 25th, '99.

Extensive developments at the depth of 2500 feet in the Congress mine are reported to have greatly increased the ore reserves in that mine,

A 20-ton mill run from one of H. T. Winston's mines at Placeritas, near Antelope Hill, averaged over $60 a ton.

A shoot of rich copper ore, carrying gold values, was encountered in level No. 2 of the Homestake mine, 120 feet below the surface. This mine is on the Big Bug and is owned by Block & Gray. The mine heretofore has been producing gold, silver and lead.

The mines, works and railroad of the United Verde Copper Co. at Jerome will be sold at auction in New York City Dec. 19. The sale will include all of the property of the company at Jerome and the issue of the stock and bonds of the United Verde & Pacific Railway, consisting of 300 shares of stock, $100 par, and 300 first mortgage bonds, $1000 par, payable Jan. 1st, 1920, with interest at 6%. The sale is for the purpose of a reorganization of the company under the laws of West Virginia with a capital of $3,000,000 stock and $3,000,000 bonds. It is now organized under the laws of New York.

CALIFORNIA.

Amador.

At the Oneida mine, between Sutter Creek and Jackson, the old 1000-foot shaft is being cleaned out and retimbered, while sinking in the new vertical shaft continues below 2100 feet.

A milling test of 357 tons of ore from the Central Eureka mine at Sutter Creek, made in the Zeila mill at Jackson has gone about $100 per ton. The shaft is down 1635 feet and 250 feet of this is in the ore shoot. Plans are being made for a new hoist and mill. W. R. Thomas, who was the active spirit in reopening the mine, is Supt.

An inclined shaft is being sunk by W. Stewart near Butte City to open the gravel deposit in Butte basin.

The Potazuba mine, at Sutter Creek, is to sink 500 feet deeper, and is reported will put in heavier machinery.

The Lincoln shaft, above Sutter Creek, is down over 1250 feet. A station is to be cut and levels run at the 1250.

Development at the copper mine at Ranlett, between Ione and Jackson, is progressing on the 100, 200 and 300 levels. The smelter will not be blown in until a large amount of ore is on the dump.

Calaveras.

The Royal Con. mine at Hodson, in Salt Spring valley, is dropping forty stamps. It is reported that a large addition is to be made to the mill, which is to be run by electricity.

The Ellen Vannan gravel mine, six miles northeast of San Andreas, is being worked with eighteen men. Mgr. Jackson has crosscut the channel and has commenced breasting. Four stamps are working and eight men are to be employed when sufficient ground is open to supply the gravel.

The Santa Ana mine, on Albany flat, three and a half miles south of Angels, has been opened to a depth of 900 feet and extensive development work done. It has been decided that the prospect does not justify further development, and the mine has been abandoned and the machinery is being removed. This vein occurs in massive diabase, which shows little of the effect of shearing and movement which is so pronounced a feature of the better mines of the gold belt in greenstone. The vein is variable in width and splits up occasionally, but was never heavily mineralized or rich. Whether this may be considered as an anomaly cannot be determined until other veins of similar character in the vicinity are opened. Its development proves it different at least from the mines which pay, though some of the veins possessing the characteristics supposed to be essential of a paying mine do not pay.

San Andreas *Citizen*: The new vein found in the 100-foot level of the Ford mine, at San Andreas, is being followed by Supt. Knight, and has been uncovered for 20 feet and is increasing in width. The vein is nearly 2 feet wide and rich in gold. Mr. Knight will crosscut for it on the 300-foot level. Later on the Ford will be opened toward the north, in which direction there has been no development in the past.

El Dorado.

The mill at the Oro Fino mine in Big canyon has been repaired and the chlorination plant put in order, preparatory to resumption of work on the mine, owned by Haywards & Lane. The shaft is to be deepened.

Inyo.

The sale of the Reward mine, near Independence, to H. H. Douglas and others of Los Angeles, Cal., is reported. There are 50,000 tons of ore blocked out. The fifty-ton cyanide plant now working Reward tailings will be bought by the new owners and maintained in operation. The mine has paid well heretofore. An air compressor and drills will be put in.

The Kearsage mine, near Independence, which has been idle a long time, is to be reopened. It is said that there is a large amount of $10 ore in sight, which will be treated by cyanide. The dumps containing 10,000 tons of ore will also pay to cyanide.

A 5-stamp mill and boiler have been moved from Randsburg to Pleasant canyon for the Radcliffe mine at Ballarat.

Kern.

(Special Correspondence).—The Kern river oil district is ten miles northeast of Bakersfield, in the edge of the Sierra foothills, and has recently come into prominence from numerous discoveries made there. The degree of its productiveness has not yet been determined.

The first discovery in the district was made by the Elwoods and George Wiseman. They had noticed indications of oil in the precipitous sandstone cliff on the north bank of the Kern river, and began a prospect hole with pick and shovel, about 50 feet from the edge of the cliff, and at a depth of 75 feet struck oil in limited quantity. Later—the 1st of last June—they began sinking a well at another point with crude apparatus, and struck oil at 46 feet. Continuing, they secured a better quality of oil at 200 feet. At a depth of 346 feet they struck oil sand and secured a flowing well. This is the pioneer well of the district. Its output is now about five barrels per day. It is a very heavy oil—specific gravity 15 Baume. It is too thick to flow readily, and is forced out of the casing in frequent gushes by gas from the underground reservoir. Locations and developments followed rapidly. The Petroleum Development Co., headed by Doheny, Butler and others, has three productive wells within 100 feet of the Elwood gusher. This company have just completed a tank of 1000 barrels capacity, their smaller tanks being full to overflowing. This company sells oil to the other outfits of the district, but as they have begun pumping from a new well within the past week they will soon be obliged to make arrangements for shipping their product. The Treadwell Oil Co. have finished sinking, and they will also begin pumping as soon as they have tankage facilities. The oil in these latter wells is lighter than that from the Elwood, and consequently more easily handled.

The Kern Oil Co., the Imperial Oil Co. and the Reed Oil Co. have two or more wells each in the order named, stretching northward from the locality above described.

In every case the workmen have struck sand permeated with oil, which shows that the oil belt extends at least three miles back from Kern river. Experts claim that the belt extends to and beyond Poso creek, several miles farther, and derricks are in position, waiting for outfits, along this entire hill territory. A. G. Newton has erected a derrick and has an outfit at work two or more miles from the hills, out upon the plains. More than ordinary interest attaches to his operations, and developments at this location are anxiously awaited. Thus far no great producing well has been struck in the Kern river district, but that oil exists in quantities to repay investment has been clearly demonstrated, and it will soon become an exporting section of fuel oil.

Bakersfield, Dec. 5th, '99.

The cyanide plant which has been operated at Cuddabock lake has been moved to the Black Hawk mine, where there are 1500 tons of tailings. Five more stamps are to be added to the Black Hawk mill when arrangements have been made to secure sufficient water.

At Randsburg the Red Dog mill has sufficient ore in sight to run continuously for three months.

Seventeen tons of ore from the Butte mine at Randsburg returned about $1800 in gold. The Napoleon is producing $100 ore, and the Wedge claim is sending up high-grade rock.

The new gasoline hoist of 130 H. P. has been installed at the Trilby mine. It is located underground 1000 feet from the mouth of the tunnel. Sinking is in progress, the shaft being down over 200 feet. The Trilby vein is 60 to 80 feet wide, and it has been opened 700 feet in length.

The Crœsus M. Co. has incorporated at Johannesburg; capital stock $10,000, all subscribed.

Congressman Needham says he has induced the General Land Commissioner "to suspend entry upon all lands which have been described in letters and telegrams," but does not vouchsafe information as to what "lands" those are.

Lassen.

The Golden Eagle mine is outputting eighty tons of ore daily. It is managed by Dr. Schloesser.

The Fairview Co. has built a steam hoist at its mine.

Mariposa.

Capt. A. H. Ward is again working the Pinon Blanco, three miles from Coulterville.

A mill is being built on the Alice Clark mine, near Coulterville.

Work has been resumed on the Quartz Mountain mine, two and one-half miles west of Hornitos.

Nevada.

The Pennsylvania M. Co. of Grass Valley have bought the Liberty Hill and Noon Summer mines, lying between the Pennsylvania and the W. Y. O. D. Veins of ore of good grade have been developed in a superficial way on the two claims mentioned. The purchase is said to add largely to the value of the Pennsylvania property.

It is reported Mr. Turner will build a 20-stamp mill at the Coe mine, near Grass Valley.

Placer.

A. Clarke has driven a tunnel into Georgia Hill, near Yankee Jim's, 500 feet, and finding he was too high to reach the channel he had started to reach, he has sunk an incline on the vein 60 feet deep and is still sinking, though contending with water. Hydraulic ejectors are employed in raising water from the slope.

The Boston & South Dakota Mining Co. have secured 1700 acres on the Forest Hill divide, near Michigan Bluff, including the Weske and Manhattan channels, which were rich when worked in former years. A channel which has never been worked has been discovered in an upraise from the Weske channel. The wash, though not large, is heavy and consists wholly of bedrock material, chiefly quartz and the harder metamorphic rocks. It is evidently one of the older channels. It will be developed and worked through the Weske tunnel. J. R. Scupham is in charge.

The recent connection of the workings of the Morning Star mine and the Big Dipper mine on the Morning Star channel near Iowa Hill, mention of which was made herein at the time, led to the belief that these mines were owned by the same company. The Morning Star property recently passed to the control of the Hidden Treasure Company, of which H. T. Power is superindendent, and the Big Dipper mine is owned by the Big Dipper Mining Co., of which Seymour Waterhouse it superintendent.

Plumas.

During the past season A. B. Summers has been developing the Peel mine, in the North Arm of Indian valley. Near the surface the ore has been prospected in a small way for many years. Last spring Mr. Summers and associates bonded the mine and began development. A shaft is down 450 feet, which shows a large ore body. Fifteen men are employed. The ore carries gold and copper, and a mill is being talked of.

Chapman & Macomber are developing the Johnny Bull mine, in North canyon, near Greenville. A double-compartment shaft is down 85 feet. A pipe line will be laid from Round Valley reservoir to secure water power under 400 feet head. The shaft will be sunk 500 feet. In the spring, it is reported, a 10-stamp mill will be built.

San Bernardino.

The Searles Borax Works, which have been idle for a long time, have been started up again by F. M. Smith of the Pacific Coast Borax Co. A large number of men will be employed.

The property of the Pacific Coast Borax Co. is in the east Calico district, about six miles east of the town of Calico. The borax deposits in the company's mines extend along the low hills for several miles, and the principal output is from a large vein of colemanite. The success of this enterprise led others to investigate the rock formations of the district, with the result that near Calico and at another place five miles northwest of Daggett large deposits were found containing borate of lime, not in the recognized form of colemanite, but as a mud shale, upturned by the dynamic forces which have elevated the rocks of the district, and indurated by pressure and weathering. These shales constitute an extensive formation and contain about 10% calcium borate in the form of minute crystals interpenetrating the finely comminuted material of the shales. Stevens & Greer, who own the Calico deposits, have made numerous successful experiments and have produced boracic acid from the shales, proving that the mineral is present in commercially valuable quantities. The deposits near Daggett are similar in character and have been developed to a depth of 200 feet. That this formation extends beneath the desert valley, between the Calico deposits and those near Daggett, there is no reason to doubt. It is reported that an extensive plant will be built at the Daggett mines to extract the boracic acid from the shales. Water will be pumped from Fish ponds on the Mojave river.

San Diego.

The new cyanide plant at Hedges will be in operation on the 15th inst.

A new mining district is being developed near Poway, and a number of claims are lo-

cated. It is called the Vallecitos district. The ore runs from $3 50 to $16 per ton.

The discovery of zinc ore is reported at San Vicente, and on Red hill between Julian and Stonewall it is reported a copper ledge has been discovered. In this vicinity are some interesting rocks similar to the "lustre mottled rocks" of Pumpeily and Irving, in the Lake Superior region. They are mostly norites, gabros and others of similar character.

A company has been organized to reopen and work the Helvetia mine near Julian.

Dr. Stephen Bowers, who has recently visited the kaolin deposits on El Cajon mountain, pronounces the material there to be nearly pure kaolin.

Santa Barbara.

Recently appeared herein an illustrated account of the pumping of oil from under the sea at Summerland. It is now reported from there that the Oxnard M. Co. has struck an asphaltum bed in the ocean while drilling an oil well 400 feet from shore.

Tuolumne.

The Arbona mill, at Tuttletown, recently completed, is running.

The App mine, at Quartz, is being run by electric power.

The Dutch mine, near the App, is run by steam. Twenty stamps are dropping.

Above Jacksonville, the Whitto-Stanley and Clio mines are being opened.

At the Draper mine, near Soulsbyville, a strike is reported. The ore in the new strike runs $300 to $500 per ton. The mine was worked down to the 300 level years ago, and was credited with a production of about $350,000. The shoot pinched and for years the mine remained idle. Three years ago it was reopened and explorations made some distance north of the old shoot, in the lower workings, but nothing of consequence developed. The new shoot has been found under the old one by sinking. Sinking is in progress. G. F. Dyer is Supt.

The new machinery for the Santa Ysabel, at Stent, is at the mine, and the management expect to have the mill in operation by Jan. 1.

A hoisting plant is being put on the Mississippi mine, at Big Oak Flat. The vein is at the lower end of the valley and cuts both slates and granite. It was formerly worked in a small way.

Sinking in the main shaft of the Goldwin mine, on the north fork of Tuolumne river, has ceased until machinery is put in. Under the present conditions it was necessary to bail the water. A new tunnel is being driven up the mountain to tap the vein, in what was originally known as the Philadelphia claim. Near the apex of the mountain there is a shaft 40 feet deep, and the tunnel will reach the vein 100 feet under this. Supt. McClintock expects to reach the vein with a 100-foot tunnel in twenty days.

Trinity.

The main adit of the Brown Bear mine is in 2500 feet. It has been turned from its former course with a view to reaching the ledge more quickly.

COLORADO.

ARAPAHOE COUNTY.

The discovery of placer-bearing ground within a short distance of Denver is reported. It is supposed to be in the former bed of Clear creek.

CLEAR CREEK COUNTY.

A strike is reported from the Newhouse tunnel at Idaho Springs. The pay streak is large and is concentrating ore of high grade. A milling vein is found continuously accompanied by these shoots of smelting ore. There is a question as to the identity of the vein, though it appears to be either the Seaton or the Tropic vein.

In the Chesapeake tunnel, in Yankee hill, the strike made some weeks ago has been opened for 125 feet and the vein still maintains its width and richness, and the pay-streak is now 4 feet wide. This vein is not known on the surface and was found unexpectedly.

GILPIN COUNTY.

Denver *Republican*: For the month ending Nov. 30th there were shipped from the Black Hawk on the Colorado road 5347 tons of ore, the production of this county for November of smelting ore, tailings and concentrates, shipped to outside smelters, and also concentrating ores shipped to the mills at Idaho Springs. During the month smelting ore shipments have fallen off, which may be accounted for by the fact that several of the biggest mines have not been producing their usual amount of ore, owing to improvements and developments under way.——At the Fisk mine on Bobtail hill a small force is working in the upper levels and another force is running a drift from the Gregory to cut under the Fisk shaft which will be completed about Jan. 1st. The drift will cut 90 feet below the shaft, now down 1010 feet, and will drain that property. After the first of the year Manager Stockbridge says they will give employment to a large force.——The Boston & Denver M. & M. Co. is putting in three 100 H. P. boilers and has completed a new building, 40x80 feet. The foundation work for the new 80-stamp mill has been commenced, under superintency of R. T. Owens. A retaining wall is being built, 181 feet long, 18 feet high and 4 feet thick.

GUNNISON COUNTY.

(Special Correspondence).—At the Continental mine a new gasoline hoisting engine is being installed with indicated 12 H. P. A boarding house has been completed at the mine and work is being hurried on shaft house and gallows frame. The shaft will soon be down 100 feet, sinking on one side of the vein, where hard rock has been encountered. This property shipped one car of ore of 9¾ tons that netted over $3000, being the only shipment ever made.

The Midland M. Co. are putting in a new steam hoist and will push work this winter. The mine has good ore, as shown by several shipments made.

At the Gunnison mine sinking is progressing and will soon reach the 300 station, where the vein will be crosscut. At the 200 station a fine body of ore was opened, there being 8 feet of $30 ore and 15 feet of milling ore, besides a 6-inch streak that runs up in the hundreds. The sinking is done with power drills. No work is being done on ore. The management will not work on ore until a depth of 500 feet has been attained.

At the Standard sinking is in progress and a body of good ore is reported to have been cut.

The Tom Boy is working, with plenty of water to keep them busy, and are finding fine ore.

Dr. Weiss of the Good Hope reports a streak of $1000 ore in the lower workings: it is about 3 inches wide, but there are several feet of lower grade ore. He is contemplating a new plant of machinery.

At the Vulcan they are doing a great deal of dead work and send out very little ore at present.

Word comes to-day of a rich strike at the Hathaway, on Cochitopa creek. A man just from the mine reports great masses of rock filled with free gold. The vein is about 5 feet wide.

A story comes to-day from the Lake Fork, near Gravioia, on the Lake City branch of the D. & R. G., where two prospectors are said to have found a vein, supposed to be the source of supply for the placers near by. It is said to be 2 feet wide, very rich and free milling. I am told they have been hunting for this vein for several months.

G. W. Greffey is about to put in a new power drill plant to work the DuBoise tunnel, which is now in 880 feet, and will cut the Pride of Denver vein in about 400 feet more, that being their objective point. The vein shows good values on the surface.

Gunnison, Dec. 2nd, '99.

LAKE COUNTY.

The Greenback mine in Graham Park is making a daily output of 125 tons of iron sulphides and is also shipping copper sulphides and lead ore.

The Resurrection mine is outputting 140 tons daily, which is below the capacity of the mine, but all that cars can be had to handle.

D. B. Jones is shipping the tailings from the Col. Sellers to Mineral Point, Wis., for treatment.

MINERAL COUNTY.

(Special Correspondence.)—The Nelson tunnel at Creede, now in about one and a half miles, is progressing at the rate of 100 feet per month. Thus far it has drained the lower levels of the Amethyst, N. Y., Chance and Last Chance, and is driving toward the grounds of the United Mines Co., still 800 feet away. It passes through the grounds of the Commodore, though the latter uses its own tunnel, which is 35 feet higher than the Nelson.

The water has been pumped out of the eighth level of the United mines, and the latter expect to begin shipping at once.

The Amethyst, Chance and Commodore are the principal shippers from Creede.

Creede, Dec. 4th, '99.

FREMONT COUNTY.

(Special Correspondence).—Dr. F. L. Bartlett, associated with H. L. Hollister of Boston, Mass., has purchased the interests of the American Zinc-Lead Co. west of Chicago, which include the zinc-lead smelter at Canyon City and various mining properties in Colorado and New Mexico. The smelting plant, which has been under the management of Dr. Bartlett for several years, is to be enlarged sufficiently to give it a capacity of 200 to 300 tons of ore per day.

Canyon City, Dec 2nd, '99.

HUERFANO COUNTY.

(Special Correspondence).—La Veta mining district has been organized in this county, taking in a portion of the eastern slope of the Sangre de Christo range. About 100 locations have been made, on some of which copper ores have been found. W. C. Fowler is developing a group of claims in the district for a California company.

La Veta, Dec. 2nd, '99.

TELLER COUNTY.

(Special Correspondence).—Specimens from the Lansing mine of the Pinnacle G. M. Co., on Bull Hill, assayed $102 to the pound, or at the rate of $204,000 per ton.

The Modoc has paid a dividend of 1% per month since August 15, 1899.

The Murphy workings on the Pharmacist recently shipped forty tons of ore valued at $20 per ton.

The Bonanza Queen lease on Iron Clad Hill is reported in ore worth $60 per ton.

For some time the operators of the Advance on Raven Hill have been sinking to catch the Jack Pot vein, opened lower down on the slope of the mountain. Last week a vein was struck at a depth of 432 feet, yielding high grade ore, but it is claimed to be a new vein instead of that of the Jack Pot.

Cripple Creek, Dec. 4th, '99.

Lessees working Eclipse No. 1, near Victor, are reported having made a strike. They have found a rich seam of talc.

At the Little Frank, on Raven hill, the lessees in sinking have struck telluride ore at a depth of 20 feet which runs $100 per ton.

On Beacon hill a strike is reported in the Janet W. mine, where a vein running thirteen ounces per ton has been cut.

The Alert G. M. Co., operating the Hardwood mine, has opened the ore body for 50 feet in width. The new shaft is down 175 feet and a new hoisting plant has been ordered, to replace the small electric hoist now in use. The new plant will be run by steam and have capacity for deep mining. A four-drill air compressor will also be put in.

The Mary Jane fraction of the Advance Co. is producing rich ore. It is black telluride of gold, the values being in the black streaks which are all through the rock. The ore is similar in character to that found in the Lafayette of the Princess Alice Co. and in the Lucky Guss. The ore body dipped into the shaft from the south and is 18 inches wide. The values are equally distributed across the entire 18 inches. Similar ore was found in the workings of the Jack Pot near the line of the Mary Jane fraction.

A new shaft is being sunk on the Doctor mine by the lessees. Upraising from the twelfth level is also in progress to connect with the shaft and another from the tenth to the seventh. These connected will make a rapid record in shaft work. A 6-drill air compressor will be put in to facilitate the work and to supply air to the raises.

Lessees working in a winze 40 feet below the tunnel level of the Mattie D. on Raven hill have struck $400 ore. The vein is 2½ feet wide. A year ago an electric plant was put in by the Ingham Co., which owns the ground and this was removed a few days since. The leasers pay 25% royalty.

The resident manager of the American Smelting & Refining Co. is reported to have notified the ore producers of Cripple Creek that hereafter only $19 per ounce will be allowed for the gold contents of their ores.

IDAHO.

IDAHO COUNTY.

(Special Correspondence).—There is no late news regarding the status of the Big Buffalo deal, although it is reported that Capt. John R. Wood has left Chicago and will take over the property. In the meantime Clark & Sweeny, having purchased the grub-stake suit interest, are standing in the door to see what the Woods Co. will do.

Interest in the Dewey mine, near Mt. Idaho, is growing. It is reported a company will be formed to work the property on a large scale. Sam'l I. Silverman is interested in the deal. The ore body recently struck averaged $70 per ton, and where sinking was commenced on the ore the vein was 25 feet in width. The ore is heavily mineralized, almost massive, fine-grained auriferous pyrites, chalcopyrite, and some free gold. The gangue is quartz. Gold is the principal value, with a nominal amount of silver and 4% copper.

An extensive placer enterprise is about to be inaugurated on Newsome creek, where surveys are in progress under W. H. Hill. A ditch will be brought onto a large tract of gravel lying hundreds of feet above the south fork of Clearwater river, and the main stream of Newsome Creek will be worked with a bedrock flume, and the south fork used for a dump.

Grangeville, Idaho, Nov. 25th, '99.

MICHIGAN.

HOUGHTON COUNTY.

Six hundred tons copper were shipped last week by steamer and navigation is closed. The next copper shipments will move by rail route. Atlantic produced eighty-two tons last week.

After a delay of two weeks, caused by an inflow of water from old workings, No. 1 shaft of the Isle Royale mine is again operating.

ONTONAGON COUNTY.

The Mass mine is raising rich copper rock from the Butler lode. Further development is awaited with interest.

NEVADA.

HUMBOLDT COUNTY.

C. H. Norton of Winnemucca has sold the Wandering Boy copper mine, near Winnemucca, for $75,000.

ELKO COUNTY.

The Young American Co. has equipped its mine with gasoline hoist, pumping plant and 10-stamp mill. The ores are low grade, but there is an abundance of them.

NEW MEXICO.

BERNALILLO COUNTY.

(Special Correspondence)—J. H. Montgomery of Denver, Colo, has investigated the proposition to erect a 100-ton smelter at Albuquerque, and is said to have made proposals to the business men of the latter place, in which he offers to organize a stock company to erect the plant and asks them to take 100,000 of a proposed issue of 300,000 shares of stock and furnish site for buildings.

Albuquerque, Dec. 4th, '99.

The Union Mining Co., of Milwaukee, Wis., has bought the Union mine, at Bland, for $20,000.

OREGON.

George K. Quine is shipping nickel ore from Riddles to the station East. He says there is a prospect for the resumption of work.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Hardin shaft on Two-bit gulch has been idle for a year and filled with water. When the mine was shut down the pump was left in the bottom. Last week baling was commenced, and after lowering the water to within 100 feet of the pump, a successful attempt was made to start the pump. The shaft is unwatered and mining resumed, the ore being hauled to Deadwood smelters.

The Tax Title (formerly Old Sam) mine at the head of Bobtail gulch, adjoining Grantz' Hidden Fortune mine, is to be worked by leasers.

PENNINGTON COUNTY.

Eight miles west of Rochford is a belt of siliceous manganese ores about 1½ miles in width. It carries values in gold from $3 to $8 and a small amount of silver. Development work is in progress.

UTAH.

JUAB COUNTY.

The Centennial-Eureka mine, at Eureka, is said to be netting $1000 daily on shipments of fifty tons of rock. Ore running less than $20 is left in the mine.

A suit pending between Stone et al. vs. the Silver City M. Co., involving title to the Jennie and Dubie claims, has been settled out of court.

A strike of ore rich in chloride of silver has been made in the Godiva shaft at a depth of 540 feet.

The Iron Blossom Con. M. Co. was recently incorporated to operate the Excelsior, Iron Blossom, Wild Winter, Little Chief and Little Giant mines, adjoining the Governor, Boss Tweed, Wolf and Santaquin, and is sinking a shaft. The Iron Blossom is an extension of the Dragon Iron ledge and embraces within its lines a large iron blowout almost identical to that of the Dragon Iron mine. Years ago the Iron Blossom and Excelsior shipped iron ore to the valley smelters for flux, the ore often running high in gold.

SALT LAKE COUNTY.

It is reported from Dry canyon that in the Mono mine the vein has been recovered. The ores assay 8 7% copper, twenty-seven ounces silver and 25% lead. The ore is principally galena, of which a fair body has been exposed. Matt Gisborn, who has owned the mine for years, was one of the original owners. At the time of its discovery the Mono was very rich. It was sold to a company by Mr. Gisborn. Then the vein was cut off by a porphyry dyke and disappeared. Two years ago it again came into possession of Mr. Gisborn. Since that time he has driven the main tunnel until, at a distance of 2240 feet, it has broken into the vein. Between the point at which the vein was recovered and that at which it disappeared is nearly 1000 feet.

TOOELE COUNTY.

J. B. Weimer has bonded the Queen of Sheba and Jumbo mines, in Deep Creek district, for two years. These properties consist of nineteen claims, located on the west slope of Ibapah range, and are about 1¾ miles apart. The Jessie Weimer group consists of eleven locations, which gives Mr. Weimer control of thirty claims, all of which are traversed by veins, in which are shoots, 4 feet in width, showing an average of $120 per ton in gold and silver. One ledge of considerable width for several hundred feet shows an average of $7 per ton.

UINTAH COUNTY.

Capt. J. A. Eade, representing the Leiter Co. of Chicago, Ill., says the shipment of elaterite will begin this month. During the last few days he has received instructions from the Eastern management to dispatch the material as rapidly as it can be mined.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence)—A gasoline hoist has been installed on the Black Bear mine, on Palmer Mountain, raising ore from the 150-foot level.

Considerable work is being done in the comparatively new camp of Myer's Creek. A bond has been taken on the Copper Queen claim for $60,000, payments distributed over one year.

Assessment work has uncovered the richest surface showing of copper ore yet found in Belcher Camp, on a small fraction called Lucky Boy.

Copper King group of four claims, near Keller, on south half of the Reservation, has been bonded for $30,000, on one year's time, by J. P. Harvey, T. Clark and associates.

The Republic mine is preparing plans for a 200-ton mill, with possible later enlargement to 1000 tons capacity. In the meantime ore will be shipped to the Trail smelter as soon as the wagon roads are passable, in order to continue monthly dividends. The new mill will probably roast the ore and treat by cyanide leaching process. The old mill is being used for experimental work along this line. Canadian capitalists, who are largely interested in the Republic mine, have purchased control of the Quilp, and are negotiating for several other of the best properties of Republic Camp, all possessing large bodies of quartz, averaging $15 to $30.

The Golden Harvest has acquired two new claims, and will use them as a tunnel site for driving a new 600-foot tunnel, under the management of F. X. Gauthier.

A contract has been let and work started on a 200-foot shaft on the Merrimac, the south extension of the Mountain Lion.

The Liberty has started work again, having uncovered a new ledge crossing their ground from the Palo Alto.

Work on the new 100-ton mill for the Mountain Lion mine is almost at a standstill owing to the difficulty of getting heavy machinery hauled over almost impassable roads. The mill building and hoist are completed, and work in sinking to the 1000-foot level and drifting from the 500-foot level still continues.

The ledge on the Hillside has been cut by a tunnel. It is supposed to be the extension of the Mountain Lion.

The Tom Thumb has a shoot of ore assaying up to $300. Surface assays on this property never exceeded from $2 to $5 in gold.

The Bonanza mine, near Bossburg, and the Deer Trail No 2, in Cedar canyon, continue to pay small monthly dividends.

Republic, Wash, Nov. 28th, '99

OKANOGAN COUNTY.

The El Dorado mine on Douglas mountain has been incorporated The ore contains copper and gold. Development will be continued through winter.

WYOMING.

(Special Correspondence).—Battle Lake district is south from Fort Steele and about nine miles north of the Colorado state line. A number of properties are being developed, from four of which small shipments have been made. The ores are a copper and iron sul-

phide, carrying principal values in copper, which lie in a contact ledge.

Fort Steele, Dec. 3d, '99.

LARAMIE COUNTY.

The mines of the Hartville district are active. Two railroads are building into the district. The ores are copper and iron. The Colorado Iron & Fuel Co. is largely interested in the district.

CARBON COUNTY.

The Eureka copper mine near Grand Encampment has passed to the control of a syndicate of Denver, Chicago, Boston and Baltimore men.

FOREIGN.

AUSTRALIA.

The new shaft of the Mount Morgan Con. mine in Queensland is being sunk in serpentine. It is down over 100 feet.

The discovery of a new tin mining district in New South Wales, near Candl, is reported. Stream tin is being sluiced and the ore has also been found in veins of quartz traversing granite and porphyry.

The deepest shaft on the Broken Hill lode is 1000 feet deep. At that level the ore body is 40 feet wide and assays 13% lead, 17% zinc, 1½ dwts. gold and 69 ounces silver per ton.

A company has been organized to work the Macquarie river by dredging.

The directors of the Sulphide Corporation, Cockle Creek Works, near Newcastle, says the London *Mining Journal*, are following a very active policy. They own the Central Broken Hill silver-lead mine, and they are endeavoring to purchase copper and lead mines all over New South Wales. They are also going into coke making, and in two months expect to start operations with twenty-five new coke furnaces. Owing to the great development of smelting operations in Queensland, Tasmania and New South Wales there is a great demand for coke.

It is reported in Sydney that a find of gold and silver at Tabrabucca, midway between the Sofala and Mudgee gold fields, has been made. The lode is 14 feet wide, and assays ten ounces gold and thirty ounces silver per ton. A rush has set in and land is being pegged in all directions. The country is composed of schists and igneous rocks, and is very mountainous. It has been little prospected, although the rivers and streams taking their rise in it have for many years yielded large quantities of gold. The new find is approached either from Bathurst, via Wattle Flat and Sofala, or by the main road from Capertee, twenty-three miles northeast.

LOWER CALIFORNIA.

At the mining camp of Alamo a strike is reported in the Avalina mine, owned by J. Guyette. The claim is west of the main camp of Alamo, near the El Paso mill site, at the base of Mount Tomaso. Other good strikes have been made recently in the same locality.

A company of Pittsburg capitalists is working the San David, Telemaco and Ulysses claims, formerly owned by the Princesa Co., and have ninety men employed under Supt. G. P. Brown.

J. M. Albright and T. Kneale of San Diego are working the tailings of the Princesa mine by the cyanide process. The dump contained in the neighborhood of 5000 tons.

MEXICO.

The mining town of Mapimi, Durango, recently celebrated its three hundredth anniversary.

SOUTH AFRICA.

The output of 17,846 ounces of gold in October from the Transvaal mines, reported from Pretoria last week, compares with 400,791 ounces in the same month of 1898, with 274,175 in October, 1897, with 199,889 in 1896, and with 192,652 in 1895. The smallest output in recent years was in February, 1893, when only 93,252 ounces was produced. Last month's decrease in value of output, as compared with September, is approximately $8,000,000.

TASMANIA.

The Mount Lyell mine is producing 5000 tons of ore weekly. The cut from the Gormanston side of the Big Blow is through the top of the hill, and shortens the distance that overburden has to be trammed. At the reduction works from nine to eleven furnaces have been in operation. The railway extension to Strahan is completed.

Commercial Paragraphs.

THE Babcock & Wilcox Co. will build a $1,000,000 boiler plant at Bayonne, N. J.

THE Denver Engineering Works Co. of Denver, Colo., have a contract for a smelting plant for Carlos Reite, Mapimi, Mexico.

A HUGE Gates crusher has been put in operation near Truckee, Cal., by the S. P. Co. to make stone ballast for that section of the road.

THE Stilwell-Bierce & Smith-Vaile Co. of Dayton, O., recently shipped through its New York office a large Victor turbine water wheel to New Zealand.

MR. DORKS, representing the Hercules Gas Engine Co. of San Francisco, is installing a gasoline hoist and pumping plant for the Young America Co., at Tuscarora, Nev.

FRASER & CHALMERS have sold one of their patent adjustable Comet crushers to the Momence Stone Co., Momence, Ill. This crusher has capacity of 200 tons per hour crushed to 2½-inch ring.

THE Jeanesville Iron Works Co. have a telegraphic order from Red Bluff, Mont., for a 22x10x18-inch mining pump; also 16x10x12-inch from Salt Lake City, Utah. The company reports that the compound condensing 800-foot lift pump for the Vindicator mines at Independence, Colorado, was shipped last week.

Industrial Notes.

—Washington will mine 2,000,000 tons coal this year.

—Portland, Or., thinks it needs a dry dock and a smelter.

—Honolulu is importing hewed cedar ties from Washington.

—Rossland, B. C., expects to get a $100,000 Government building in 1900.

—About 600 coal miners have struck for increased wages at Diamondville, Wyoming.

—Mexico is monthly sending 15,000 pounds of rubber to the United States, at 40 cents per pound.

—A motor stagecoach is being built at Vancouver, B. C., to be operated on the Ashcroft-Cariboo road.

—In '98 Colorado coal miners were paying diggers 65 cents per ton; now they are paying from 75 cents to $1.

—The S. P. Co. is credited with intention to build a cut-off across Great Salt Lake, from Lincoln to Ogden, Utah.

—R. E. Moody of Portland, Or., has bought the Grants Pass, Or., Water Co.'s plant, and will spend $10,000 in betterments.

—The Chicago, Burlington & Quincy Ry. Co. has voluntarily increased the wages of its engineers, firemen and switchmen about 10%.

—American manufacturers are selling to the outside world over $100,000,000 worth of iron and steel in excess of any earlier year in their history.

—Liverpool, England, figures that the South African demand for horses therefrom will at last admit the operation of electric railroads therein.

—A $25,000 refinery has been put in at the Sunset Oil Co.'s works, Sunset, Cal., where the entire output will be refined and distillates manufactured.

—The Middle Terminal and Florence & Cripple Creek railroads, the La Bella Water, Mill & Power Co, the Metallic Extraction Works and the Colorado Trading & Transfer Co., of Cripple Creek, Colo., have consolidated.

—For years there has been a standing reward offered by the Nebraska Legislature of $4000 for the discovery of a marketable vein of soft coal, 26 inches thick, in that State. A discovery, on which the reward is claimed, is reported in Decotah county.

—The contemplated advance in Chicago-Atlantic seaboard rates of 15%, which is expected to become effective January 1, will not affect through freight rates from Pacific coast points, unless the Eastern tariff is revised by the Interstate Commerce Commission.

—Albuquerque, N. M., has the record of the greatest number of sunshiny days in the year of any town on the American continent. Santa Barbara, Cal., has the record of the most equable temperature, and Neah bay, on the Washington coast, the greatest annual rainfall.

—A bill has been introduced in the U. S. Senate for the construction of a Pacific cable by the Navy Department, to be operated by the Postoffice Department, and appropriating $11,000,000 for this purpose. It is to run from San Francisco to Manila, via Honolulu, the Midway islands, Guam and Iloilo.

—A pending amendment to United States coinage laws reduces the standard weight of the unit of value from 25.8 to 25⅝ grains in the gold dollar, 900 fine, and makes all gold bullion of equal quantity and quality legal tender, as though coined. The amendment degrades the greenback to the position of a warehouse certificate which can be exchanged for gold.

—Stockmen may file on 160-acre tracts of land for reservoir sites. The fee is $3 for each filing. One may hold the land for two years, at the end of which time a reservoir must have been built on each 160-acre tract. If the reservoirs are built, and contain water, then the holder of the land, without further fees, files an affidavit each year, and thereby holds the land.

—The Kaslo & Slocan Ry. Co. has 350 men at work on its line from the head of Kootenay lake, B. C. That road is now building up on one side of the Duncan river. The Canadian Pacific has been constructing a parallel line across the stream. The Canadian Pacific Railroad outfit has suspended work for the winter. The Kaslo & Slocan people are pushing steadily ahead to reach the summit.

—All but one of the Australian colonies have now given their adhesion to the proposals for federation and the establishment of the Commonwealth of Australia. The sixth —Western Australia—is about to take its referendum vote on the question, and as there is little doubt that the answer will be in the affirmative, hardly a year is likely to elapse before the election of a federal parliament.

—Years ago on the Mississippi was an unwritten law that allowed steamboats to take wood wherever it was found convenient when needed, if they compensated the owner. Railroads now appropriate coal on their line in transit the same way. A Kansas mine operator says: "I start a car of coal to Wichita and it is just as liable as not to turn up next morning, or what it left of it, in the tender of a locomotive in St. Louis." One road is said to have on its side tracks at Kansas City, Kansas, 1000 cars of coal which it has thus "commandeered" in the last thirty days, and other roads have their side-tracks crowded with coal.

Personal.

T. A. RICKARD has returned from London to Denver, Colo.

CHAS. WARD RAYMOND of El Dorado county, Cal., is in San Francisco.

E. BOYCE, Pres. Western Federation of Miners, is now in Butte, Montana.

F. W. BRADLEY has returned from Grass Valley, Cal., to San Francisco.

J. W. HANSON of the San Francisco Giant Powder Co. is in Tucson, Arizona.

C. H. MCINTOSH of British Columbia is examining mining property at Sumpter, Or.

DR. F. P. HICKS, a Tacoma, Wash., mining man, has returned from Ketchikan, Alaska.

CHAS. DYER is the new Mgr. of the D. & R. G. Ry., with headquarters at Denver, Colo.

HERMAN LANDAU succeeds Jas. Judd as chairman Associated Gold Mines of Western Australia.

L. S. J. HUNT, an American miner with large concessions in Korea, has returned to San Francisco.

W. H. HONNOLD, formerly of Calaveras Co., Cal., is now Mgr. Coronado mine, Metcalf, Arizona.

DUDLEY GRAY is collecting Cripple Creek, Colo., gold ore as specimens for exhibition at the Paris Exposition.

W. J. CLARKE, foreign Mgr. of the General Electric Co., expects to return from South America next month.

H. D. CRIPPEN of the Jackson Drill & Mfg. Co. of Denver, Colo, has returned from a trip through New Mexico.

J. G. B. HOLLINGSHEAD of Montana is examining California copper properties for the Butte & Boston M. Co.

G. H. KINGSWELL and W. H. Shockley have finished a mineral survey in the Chinese provinces of Shensi and Shansi.

G. W. BLOOD, formerly Supt. Big Dipper mine, near Iowa Hill, Cal., is now Supt. of the Ontario mills, at Park City, Utah.

D. JUTTON, formerly Supt. of the Royal Con. mine at Calaveras county, Cal., is to assume charge of the Womble mine near Royal.

JNO. M. WRIGHT succeeds A. H. Ricketts in the chairmanship of the Mineral Lands Committee of the California Miners' Association.

ARTHUR WILLSON, who left Radersburg, Montana, for Cecil Rhodes' South African kingdom, is now at the De Beers mine, Salisbury, S. A.

D. C. JACKLING, who for some time past has been Supt. of De Lamar's Golden Gate Mill at Mercur, Utah, has accepted the superintendency of the Republic M. Co. at Republic, Wash.

GEORGE W. DICKIE, of the Union Iron Works in San Francisco, recently in New York, at a meeting of the Society of Naval Engineers, predicted that within a few years would be built on the Pacific coast steel ships 1000 feet long.

E. D. PORTER of Joplin, Mo., Pres. Zinc Miners' Association, talking of the decline in spelter, says he sees no hope for an immediate improvement in the spelter market. He thinks that spelter, being a subsidiary metal, and 60% of it being used for galvanizing purposes, will have to suffer on account of the scarcity of iron.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC WEIGHING MACHINE.—E. Hanak, San Francisco, Cal., assignor to the Union Scale & Manufacturing Co., Sacramento, Cal. No. 637,989. Dated Nov. 28, 1899. This invention is designed to weigh materials such as coffee and other granular or powdered substances which will flow by gravitation. It consists in the connection with a source of supply of a measuring chamber into which the material flows by gravitation, said chamber having means for adjustment whereby its size can be regulated according to the density of the material to be measured. It is provided with alternately closing and opening inlet and discharge gates above and below, a weighing receptacle into which the material is discharged in bulk from the measuring chamber in quantities less than the exact amount to be weighed. In conjunction with this is a chute with controlling gate through which a small quantity of the material is allowed to flow after the main portion has been delivered until the scale which carries the weighing receiver tilts. A controlling electromagnetic device is actuated by this tilting, and incidentally closes the supply gate, and at the same time a discharge gate at the bottom is opened and the apparatus returns to its normal position. This breaks the electric circuit and the discharge gate is closed by a counterbalance weight and the supply gate is again opened to admit a new supply to the machine, which thus continues to operate automatically.

ELECTRIC LOG RECORDER.—L. T. Jones, Jr., San Francisco, Cal. No. 637,992. Dated Nov. 28, 1899. The object of this device is to transmit a record and registration of a log used in determining the speed of vessels to the pilot house, chart room, or other desired point or points. It consists of a make and break mechanism carried by the log, a distant counting mechanism with an electro magnet and connections between it and the make and break mechanism, ratchet wheels, pawls, and a spring-pressed fulcrumed lever whereby the indicators are caused to move over suitably graduated dials or surfaces from which the speed of the vessel can be ascertained at any time.

KNIFE AND FORK CLEANER.—A. Rantala, Navarro, Cal. No. 637,974. Dated Nov. 28, 1899. The object of this invention is to provide a means for rapidly cleaning knives, forks and similar articles. It consists of a roller revolubly mounted having a surface adapted to retain and carry cleaning material, an adjustable support for the article to be cleaned, mechanism by which it is advanced and retained in contact with the cleaning roller, and a means for disengaging and returning it after it has been cleaned.

SCREWDRIVER AND HOLDER.—George Hoepner, Sandwich, Ill. No. 637,990. Dated Nov. 28, 1899. The object of this invention is to provide a device for holding screws while they are being inserted and driven. It consists essentially of a clamp which is adapted to seize and hold the shank of the screw just below the head, a screwdriver with means for adjusting it with relation to the clamp, so that its point engages the slot in the screw-head so that the screw is held straight and can be entered and driven to a certain point, when the clamp mechanically disengages from the shank and allows the screwdriver to advance between the clamping jaws until the screw is properly seated.

ROTARY ENGINE.—J. H. Darragh, Oakland, Cal., assignor of three-fourths interest to J. H. Thompson of same place. No. 637,986. Dated Nov. 28, 1899. This invention relates to improvements in rotary engines in which a piston fixed to the periphery of a disk mounted upon a shaft travels in an annular channel in the casing, with means for applying the pressure of the steam to continuously propel the piston and rotate the disk. An abutment is provided which allows the piston to pass and incidentally closes behind it, this abutment being in the form of a rotary segment, the periphery of which contacts with the periphery of the piston-carrying disk at all times, except when the segmental portion momentarily coincides with the inner periphery of the case while the piston is passing. In connection with this are valves with means for adjusting them to admit the steam or other medium upon either one side or the other of the abutment to reverse the motion of the engine, with valves by which the exhaust is also correspondingly changed.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOVEMBER 28, 1899.

638,131.—FURNACE—J. B. Archer, Oakland, Cal.
638,194.—FISHING REEL—A. J. Arnold, National City, Cal.

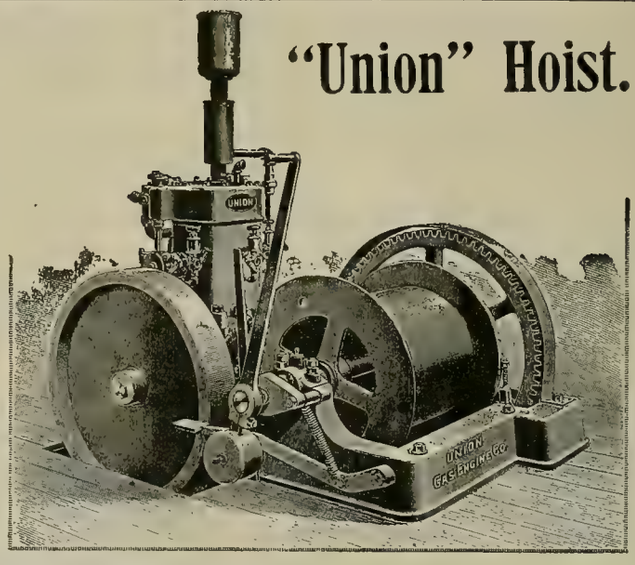
WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.



Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

DEWEY, STRONG & CO.,
PATENT AGENTS, 330 Market St., S. F., Cal.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

1172 West Lake St., CHICAGO, U. S. A.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.
55-57 Market St., Chicago. 120 Pearl St., Boston.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**

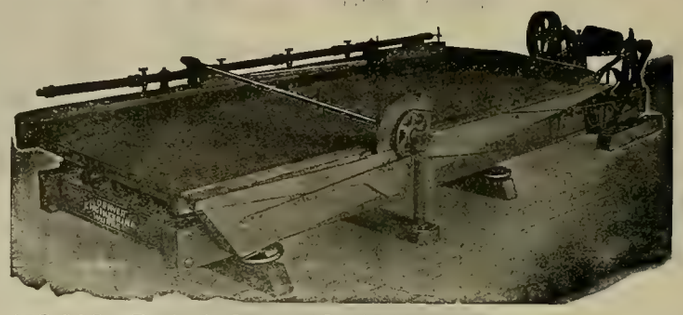
We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



(SEE PAGE 710.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

THE
"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

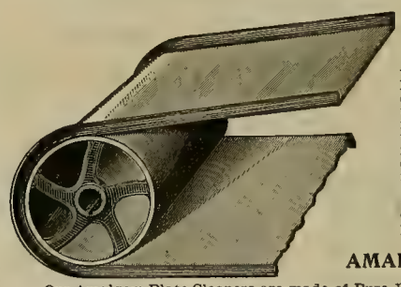
MINE BELL SIGNALS.



Adopted, Used and in Force in Accordance with Law.

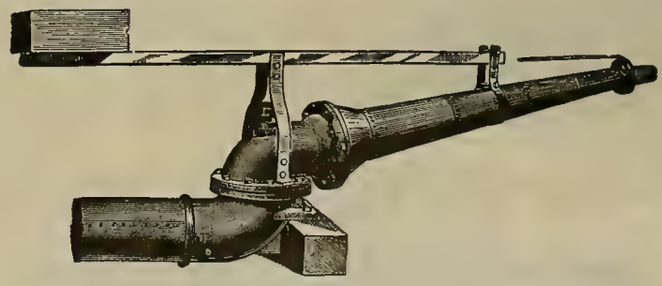
We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.



AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

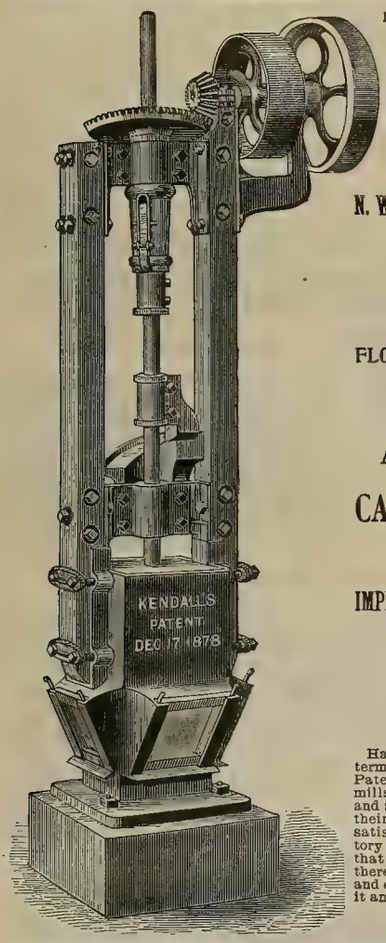
THE BRYAN ROLLER QUARTZ MILL.

We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result — they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : :

Strong.
Economical.
Simple.

MANUFACTURED BY



◆◆◆◆◆◆◆◆◆◆◆◆

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

Market Reports.

SAN FRANCISCO, Dec. 7, 1899.

SILVER.—London, 27 3-16d; New York, 59; San Francisco, 58⅞@59; Mexican Dollars, 47½@48¼; New York exchange, sight, 7½; telegraphic, 12½ cents premium.

The total metallic stock in the United States on July 1, '99, was: Gold, $962,865,505; silver, $639,286,743. The estimated production of the precious metals in the United States during the calendar year '98 is as follows:

	Fine Ozs.	Commercial Value.	Coining Value.
Gold.....	3,118,398	$64,463,000	$64,463,000
Silver.....	54,438,000	32,118,400	70,384,485

The estimated production of the precious metals in the world during the same period is:

	Fine Ozs.	Commercial Value.	Coining Value.
Gold.....	13,904,363	$287,428,600	$287,428,600
Silver...	165,295,572	97,524,500	213,715,400

The total coinage of gold and silver by the various countries of the world during the calendar year '98 was: Gold, $395,477,905; silver, $149,282,935. Total, $544,760,840.

LEAD.—New York reports steady, $4.70 bid, $4.80 asked; brokers' price, $4.40.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6½c.

COPPER.—New York reports Lake at $17 @17.25; brokers' price, $17@17.25. Local—Mill copper plates, 23¾c.

Copper has been quiet the past week and shows little strength. There is still a disposition in England to combat the American market, dealers refusing to believe that the present prices are not the result of demand and supply.

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

The amount of iron left in the open market for the first half of next year is very small. The only relief for those who have no iron contracted for is to depend on the new and small furnaces that are now being blown in.

STEEL.—11¼@20c per pound.

TIN.—Weak, $27 bid and $27.25 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@ 14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER. — Local, $51.50; export, $46.50@47; carload lots, special rates.

Within the week quicksilver has taken another upward bound of $1.50 for domestic and $1 per flask for export metal. Conditions previously described have not materially changed. The demand simply continues to exceed the supply, with a consequent rising price.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

ZINC.—Firm; $4.67½ bid, $4.72½ asked.

Spelter shows a firmer front this week and prices have advanced accordingly. The smelters still refuse to pay the Miners' Association prices. Recent prices have been $32 50 per ton in the bin. Since Jan. 1st zinc ore sales in Joplin district have exceeded 460,000,000 pounds, the value of which was about $10,000,000.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c, No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

NAILS.—List per keg: No. 20 to 60d, wire, $4.45; cut, $4.15; 10 to 16d, wire, $4.50; cut, $4.20; 8d, wire, $4.55; cut, $4.25; 6 and 7d, wire, $4.65; cut, $4.35; 4 and 5d, wire, $4.75; cut, $4.45; 3d, wire, $4.90; cut, $4.60; 2d, wire, $5.15; cut, $4.85. In carload lots, special rates in carload lots 10c per keg less.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c per lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1¾c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5½ @6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@ 2½c; California refined, 1½@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c per 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 50
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd.	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 00

COKE. — Foreign, $13; domestic, $12 per ton.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.24; less than 200 gals., $1.28; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 51c; cs., 56c; raw, bbl., 49c; cs., 54c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 19½c; Astral, 19½c; Star, 23¾c; Eocene, 21½c; Extra Star, 23¾c; Elaine, 24½c; Water White, bulk, in tanks, 13½c; Mineral Seal, iron bbls., 21c; wooden bbls., 23¾c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 59c; cs., 64c; No. 1 bbl., 49c; cs., 54c; Neatsfoot Oil, bbl., 55c; cs., 65c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

A Chicago dispatch says: "Another sharp advance in crude petroleum was made by the Standard Oil Co. to-day, the Pennsylvania product being pushed up 3 cents to $1.64 a barrel and Indiana oil 2 cents to $1.11. Altogether, since the upward movement began four months ago, oil has risen over 40 cents a barrel. Production is said to be 20,000 barrels a day below the demand. Refined oil has gone up from 2½ to 3½ cents. To-day's quotation was at the highest point in years."

100 STAMP MILL

FOR SALE, complete with or without water wheels, generators, dynamos, motors, electric locomotive, copper wire, about five miles of 56-lb. rail, ore cars and other machinery. Plant entirely new. Never operated. Of latest and most approved design. For information, address FRASER & CHALMERS, West 12th Street and Washtenaw, Chicago, Ill.

Mines for Sale.

A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.

H. B. RUNKLE, Mining Broker, El Paso, Texas.

FOR SALE.
Gold Properties in Various Stages of Development.

Single claims and groups. Large gravel properties, dredging and hydraulic. Undeveloped copper properties. PACIFIC MINING & DEVELOPMENT CO., Redding, Cal.

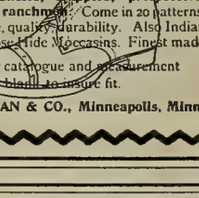
..CRIPPLE : CREEK..
FOR SALE—CYANIDE PLANT,

100 tons daily capacity; in first-class condition to handle Cripple Creek ores.

Plant in full running order, with all latest improvements. Address JOHN S. MACBETH, Equitable Building, Denver, Colorado.

FOR SALE CHEAP.

80 H. P. CORLISS ENGINE;
TWO STEEL BOILERS, 50 H. P. EACH;
HEATER AND STEAM PUMP.
All in first-class condition.



THE VISALIA MILLING CO.,
VISALIA, CAL

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

PUTMAN BOOTS
—for Sportsmen

Hand Sewed Waterproof
Black, brown or straw color.
Leaders for 22 years among Western hunters, trappers, prospectors, miners, and ranchmen. Come in 20 patterns. Possess style, quality, durability. Also Indian Tanned Moose Hide Moccasins. Finest made
Send for catalogue and measurement blank to insure fit.
H. J. PUTMAN & CO., Minneapolis, Minn.

WEST COAST OF MEXICO.

WÖHLER, BARTNING Suc's, Mazatlan (Sinaloa), Mex.
Bankers, Importers, Exporters and Commission Merchants.

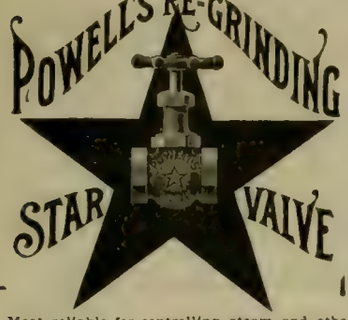
Representatives and Agents of the principal Mining Companies in the State of Sinaloa and the dependencies of the Pacific coast in the States of Durango, Chihuahua, Sonora, Lower California and Jalisco.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

FOR SALE.

New Hercules Gasoline Hoist, 35 H. P., built in sections for transportation—never been used—**WILL BE SACRIFICED.** Also 12 H. P. second-hand Hercules Gasoline Engine, in guaranteed order. Address E. H. PALMER, 405 Sansome St., S. F., Cal.

"SMOOTH ON" CASTINGS



FOR LEAKS AND FRACTURES IN STEAM OR HYDRAULIC WORK IS MAGICAL.

It repairs a blemish in iron castings with a durable metallic iron finish that can be polished and will withstand a red heat. It makes a superior flange joint for steam, water or oil.

Write for Catalogue. Manufactured by **SMOOTH ON MFG. CO., Jersey City, N. J., U. S. A.**

MESSRS. MADISON, BRUCE & SELLERS,

34-36 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR PACIFIC COAST

Most reliable for controlling steam and other fluids. Can be reground, if necessary, while valve is in position on steam pipe.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Co-Operative Milling

Throughout the mining regions of the world are many districts where the mines are small and the ore shoots narrow, short and irregular, but of good grade. In such mines these shoots often follow each other as a succession of accumulations of ore, and as a whole the mine, though less satisfactory than one having a continuous ore shoot, is capable of development and successful operation if proper facilities obtain.

Mines of this class are not confined to any particular geological formation, but are most commonly found in regions of mica schist and mica slate, where dykes and fissure veins are absent or at least not abundant and where the ores occur as lenses in the schists following along a line approximating the strike of the formation. Not infrequently the mines of this character in a district are numerous and as a whole will supply sufficient ore for one or two mills located at central points, to which all the ores of the district may be taken for treatment; but unfortunately it is not at all uncommon to find a dozen mills for as many mines, and not one of them running continuously.

Miners commonly object to custom mills on the ground that the charges for milling exceed the cost, overlooking the fact that interest on invested capital and the deterioration of the plant render this additional charge necessary, and as custom mills are not run as philanthropic institutions the mill owners make an additional charge for profit, and not infrequently the charges are higher than they should be, being determined by the richness of the ore and the natural result of competition if there be more than one mill in the camp or district.

In districts of this kind the miners would do well to associate themselves into a co-operative company for the treatment of the ores from the mines of shareholders, those who are not shareholders being charged an additional price for the treatment of their ores. The mill should be equipped with all modern devices for the economical handling and treatment of the ore and should be in charge of careful, competent men who thoroughly understand the treatment of the ores of the district, in order that the greatest possible saving may be effected at the lowest cost. Ore from the mines could be treated in such an establishment at a stated cost per ton, the amount to be determined by the actual cost of treatment, to which should be added a sum sufficient to cover the deterioration of plant and repairs. In this way the owners of stock in the mill could have their ores treated at as low a cost as though each mine owned a mill, and probably with better results by reason of superior direction and treatment. An arrangement along these lines would result in keeping the mines interested constantly working and the mill would find continuous employment.

There is no intention to go into the details and minutiæ of such a proposition as that suggested, as in each district these matters would naturally suggest themselves. In California there are several districts where this plan should be successfully introduced, where at present there are few mines at work and only idle mills or no mill at all, but where are found numerous small mines having veins of moderate size but of good grade, and where the individual owners are too poor to build a complete mill unaided, but where, by co-operation, the desired result may be attained along the lines suggested.

The mills now in these districts, or formerly there, were built for custom work or were erected by owners of mines which failed to supply the necessary ore, and were shut down. In some cases they also were run for a time as custom mills, charging a rate higher than the value of the ore could stand.

DESPITE the repeated warnings and constant caution from various sources, miners still persist in taking desperate chances in handling nitro powder, particularly in thawing it when frozen. Last week men employed in a Shasta county, Cal., mine laid a quantity of giant powder on top of a boiler in the hoist for the purpose of thawing it. Fortunately the powder did not explode—it took fire, and as a result the entire plant was destroyed.

GENERAL LAND COMMISSIONER HERMANN has decided that the tide lands of Alaska are not public lands which are subject to disposal or sale to individuals, and that no statutory provision exists giving the Government authority to grant concessions to individuals or associations. This is important to the beach miners of the Cape Nome and other districts in Alaska, as it leaves equal rights to all and no one can contest a miner's right to a claim excepting the Government itself. Local rules made by the miners will doubtless define the size of claims and the rights of locators.

Gold Output of the World.

The production of gold is now greater than at any time in the history of the world. At one time, when the production of the mines of California swelled year after year until it reached more than $80,000,000 in a single year, some apprehension was felt lest gold become too abundant and that the metal would be demonetized, as silver now is. The output for the present year of the South African mines alone is about $100,000,000 and still no fear is expressed that it will overreach the requirements of civilization. On the other hand, effort is being directed to increase the output very materially as soon as political conditions will permit. The recent report of Director of the Mint Roberts is of unusual interest in regard to increasing gold production. In closing his report he says:

The production of gold in all of the important gold fields of the world is increasing rapidly, and with prospects of continued gains for years to come. The yield in the world in the calendar year 1898 was $387,000,000 against $338,000,000 in 1897. The production in Australia to date in 1899 has shown a gain of 25% over the corresponding months of 1898, which indicates a probable gain for the full year of $16,000,000. The United States, Canada and Mexico will doubtless increase their production $18,000,000. In South Africa the production in the first half of the year was 35% above the yield of the same months in 1898, and if the industry had been undisturbed the gain for the year would probably have been above $20,000,000.

A National Necessity.

The Calaveras Co., Cal., Miners' Association has turned its attention to excellent, practical work—the improvement of the roads in Calaveras Co. It is most commendable enterprise. The condition of some of the "roads" in some of the California mining counties is a direct and continuous injury to the prosperity of those counties and a constant hindrance to their mining industry. It is unnecessary to discuss the causes, usually inertia, political complications, local inability to understand the necessity of good roads. As a business proposition nothing in the way of public utility pays better than a good road. It is the poorest kind of business to put up with the miserable makeshifts found in some parts of California, and the matter has often aroused the just indignation of mining men, especially when they see more public money annually fooled away than would build good roads. Miners have repeatedly written us, and personal inspection has often showed that what they said was underrated rather than exaggerated. It is no unusual thing to note $40,000 worth of mining machinery "stuck in the mud" along the "road" for weeks, in transit from the railroad to the mine. If the Calaveras Co. Miners' Association can awaken local public opinion, can induce the supervisors to realize that the annual gain to their county would be many times what a system of good roads would cost, and can keep at the idea till they get it in practical shape, they will have done a great work. Without belittling advance in mining methods, it may be said that no progress in mining, no "revolution" in the science or art of economically treating ore, is so important an item in the cost and profit of mining as cheap travel. Bad roads keep out investors, kill enterprise, make costly all movement, and keep a community behind the times.

This is not intended to apply solely to Calaveras county, Cal. The commendable action of that local mining association is a text to direct attention to what is a national neglect, and the existence of a natural need. Everywhere is apparent the need of good roads—roads that a horse can draw a load on or carry his rider without undue effort. A horse can draw on the worst kind of road about four times as much as he can carry on his back. On a good macadamized road he can pull ten times as much, on a wooden road twenty-five times as much, and on a tramline fifty-eight times as much. It is a trite subject but an important economic one to every investor in the mining regions. Bad roads are a terrible tax on the mining industry, and one that ought not to be borne. The gold yield of Cripple Creek district, Colo., for the current year of '99, will be $20,000,000. Cripple Creek has splendid gold producing properties — so have other districts. Cripple Creek also has the best system of "getting around" that the writer ever saw in any mining district. Cripple Creek's transportation system cuts some figure in its great gold yield.

Annual Assessment Work.

The time for completing annual assessment work on unpatented mining claims for the year 1899 is nearly at an end and it is an appropriate time to call attention to some facts in the matter. After discovery the locator is allowed certain periods to perfect his location, and the period of one year from the first day of January next succeeding the date of location in which to perform his $100 worth of assessment work. Failure to perform the assessment work does not of itself invalidate the location, for it remains intact until relocation is made by another party, when the rights of the prior locator cease immediately. The only way in which an original locator may save a claim upon which he has failed to perform the required annual labor is by resuming work before any other person claims the ground by virtue of relocation—and the assessment work so commenced must be completed, the claim holder using reasonable diligence in its performance. A locator who has allowed his claim to become subject to relocation by reason of failure to perform the assessment work cannot save it by relocation, as this would permit him to hold his claim the same as though it were the original location and by repetition he might thus hold the claim indefinitely, and as the law does not limit the number of locations a person may take, a single individual might locate and control a large number of claims in a single district and hold them to the exclusion of all others without performing any work, and this is contrary to the purpose and intent of the law. As an original locator cannot treat his own failure to perform or resume work as the basis of a new and valid relocation, it necessarily follows that one of several locators seeking to obtain the entire title by reason of the failure of any of them to fulfill the requirements of the law, is likewise prohibited from making such location.

Auction of Mining Lands in Siberia.

The Russian Government has recently been offering to lease its mining lands in eastern Siberia, and will auction the privileges for working the alluvial deposits of certain river systems to the highest bidder. A circular issued by the Government, and which has been translated by the American Minister at St. Petersburg, sets forth the conditions under which the successful bidders may operate. Among these many requirements are the deposit of a guaranty of $51,500 (100,000 rubles). The term of lease is fifteen years. The inhabitants, with their reindeer, have the privilege of roaming at will over the leased tract, hunting, fishing or otherwise employing themselves; the preliminary prospecting must be completed within the first three years of the term of the lease; the lessee must maintain at the works an assistant surgeon, with all necessary medicines, and to pay the Crown annually $515 for the maintenance of a physician; he must maintain a police force in proportion to the number of workmen employed in the ratio of 1 to 30, and to furnish the police with food, clothing, comfortable lodgings, etc., and to pay to the Crown, as wages for each policeman, 600 rubles, and $1030 for an assistant engineer and police inspector. These officers must be provided with comfortable homes, transportation, and even luxuries, and a justice of the peace must be maintained and supported. Foreign employes are allowed only by particular sanction of the Governor-General in each case. As security for certain duties and taxation $15,150 will be retained from the deposit of $51,500 made on the auction day, and in case of non-fulfilment of the terms of the contract the $15,150 will be forfeited. The lessee is subject to all the existing mining laws of the Russian Government, and will also be subject to all laws which may hereafter be enacted.

The above and many more provisions are found in the circular, the most of them imposing such conditions as would seem to seriously affect the successful outcome of what may be considered an extra hazardous proposition, to say nothing of the uncertainty of the character of future legislation.

Beside this the laws affecting the mining industry in the Transvaal are generous. It is not likely that much American capital will seek such investment. Doubtless, the mountains of eastern Siberia have valuable mineral deposits, and the streams of that region are known to be gold bearing, but it is doubtful whether, with the uncertainty which attends all new mining ventures, and the rigors of the long winters in eastern Siberia, the conditions justify investment under the terms imposed by the Russian Government.

THE fluctuations of silver from day to day or month to month are so small as to attract little attention. Any considerable rise in price would be the signal for a largely increased production. This is evident from the fact that silver mines, closed several years ago when the price fell rapidly, have recently resumed operations and are again being worked at a profit, made possible by modern methods and improvements in metallurgy. Among the noted silver producers which were closed for a time and are again producing are the Ontario, at Park City, Utah, and the Granite Mountain–Bimetallic, at Phillipsburg, Mont.

Concentrates.

BLACK tellurium found in Colorado is telluride of mercury.

KEROSENE introduced drop by drop into the boiler is recommended as a scale preventive.

A LODE claim can not legally be recorded until a vein, or lode, has been discovered thereon.

THE shaft of the Old Abe, White Oaks, is the deepest mine working in New Mexico—1150 feet.

RIGID government tests of Pacific coast fir and Eastern oak show the decided superiority of the former.

ON its trip of 17,156 miles of sea voyage from the Pacific to Cuba, the boilers of the battleship Oregon consumed 4155 tons of coal.

SO FAR as can be learned, there is no standard or unit of illumination. Common experience seems in this case to be the only criterion.

PRACTICAL men usually make the best theorists, as they know when a theory is required and the purpose it is intended to accomplish.

STEAM at 100 pounds pressure above the atmosphere does 4780.8 foot-pounds more work than that at 15 pounds pressure above the atmosphere.

THE strength of a man for continuous work, maintained for eight hours a day, is estimated at one-tenth of a "horsepower," or 74.6 watts.

FLASH POWDER for photographic purposes may be made by mixing 40 parts magnesium, 40 parts permanganate of potassium and 20 parts peroxide of barium.

A TWO-PAGE, fully illustrated account of the proposed "magnetic" reduction of gold ore by T. A. Edison, in New Mexico, appeared in the issue of April 30th, '98.

BOOKS on mining and metallurgy are free of duty. This office will send, postpaid, anywhere that mails are delivered, any required work, procurable, at publishers' prices.

ACCURATE underground mine surveying is essential as a preventative of fatal accidents, is important as a measure of economical working, and is often of great value in case of litigation.

WHERE the weight of a full car is 4200 pounds, the weight of the empty car is 1600 pounds, and the weight of the rope 2000 pounds, the grade per cent at which single cars will run is 32.5.

THE dangers arising from inhaling the fumes of potassium cyanide are declared to be as dangerous as to drink a solution of the chemical. Peroxide of hydrogen is said to be an antidote in either case.

THE introduction of steam traction engines at the Grand Reef mines of J. W. Mackay in Arizona is said to have reduced the cost of transportation between the mines and the railroad from $8 to $3 per ton.

EXPERIMENTS are in progress with a view to making aluminum from corundum—the oxide of that metal. It is thought that it will prove cheaper than that made from bauxite, cryolite or other aluminous minerals.

So far as known the largest pump is at Lake Linden, Mich., pumping water for the Calumet & Hecla M. Co., at the rate of 2,500,000 gallons per hour, a triple expansion pumping engine, requiring 1500 H. P.

SHIPMENTS of lead ore in the shape of sulphates are very unusual. Smelters usually receive lead ore shipments in the form of sulphide (galena) or carbonate, the former being largely in excess of the latter.

AMBROINE is an insulator made of amber, asbestos, mica and other silicates. It costs considerable, but is worth all it costs, and is largely used for accumulator retaining cells, and overhead fixtures for railway lines.

IN accordance with the mining laws, discovery and appropriation by locating are recognized sources of title to mining claims, and their development by working is the condition by which they may be held until patent is obtained.

FROZEN NITRO POWDER is not positively dangerous, but when thawed rapidly its tendency to explode without apparent cause has often been demonstrated. The season of the year when warnings of this kind are in order has arrived.

A RANCHMAN in Nevada put a blast in the debris beneath the old copper smelter at Mason Valley recently and exposed nearly 8000 pounds of metallic copper, worth $1200, that had leaked from the furnace, which was a crude affair when new.

YES; a mine inspector would be a good thing for California; but, were the office to be created, the man competent to fill the position would stand little show of selection. It would be just one more office for the politicians to gnaw and snarl over.

THE ore from Forest Grove, Or., is chiefly chrysocalla (silicate of copper) with the common brown garnet crystals of the variety grossularite—a calcium aluminum garnet. There is also a small amount of copper carbonate (malachite) in the specimen.

ALL mail matter passing between the United States, the Philippine archipelago and Guam, or between these island possessions of the United States, are subject to the United States domestic classification, conditions and rates of postage.

ON the dumps of the Minnie Moore and Queen of the Hills mines at Hailey, Idaho, there is said to be a large quantity of ore which assays $5.50 per ton, to recover which no method has as yet been discovered. The quantity is said to be 200,000 tons.

HYDROGEN has lately been liquefied. It is a limpid fluid, clear as water, with one-fourteenth of that liquid's specific gravity. A piece of cork dropped into liquid hydrogen goes to the bottom like so much lead. It is most intensely cold; air freezes and sinks in it.

THE bureau of the U. S. Mint is under the Treasury Department; the General Land Office and Geological Survey are under the control of the Secretary of the Interior. The latter is in intimate connection with the mining industry of the nation and has done good work for the miner and prospector. The U. S. Geological Survey is always up to and often a little ahead of the requirements of the miner and furnishes a vast amount of necessary information at the minimum of cost.

AT the present rate of output, it is estimated that it will require thirty-five years to exhaust the copper conglomerate still remaining within the boundaries of the Calumet & Hecla property; but the Osceola and Kearsage lodes also pass through the company's holdings.

MINING MEN in every capacity are constantly and cordially urged to take notes of facts within their observation, and furnish them for publication. Practical workers can thus greatly add to the common stock of knowledge with resultant public benefit and individual gain.

TRACTION ENGINES have been found to be more economical in operation than an eighteen-mule team. An example is afforded by one hauling daily thirty tons of ore in two trips to Globe, Arizona, from a mine three miles distant, at a cost for labor, fuel and oil of 27 cents per ton.

ANY mining man when visiting San Francisco can have his letters addressed to the headquarters of the mining men, office of the MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco. Letters thus sent will be promptly delivered upon application, or forwarded as required.

A PUMP cannot, with economy, be run at a higher velocity than that at which the water, entering under the pressure of the atmosphere, attains—a velocity equal to that of the piston speed of the pump. The law, in common with that of all fluids, is that the velocities vary as the square roots of their pressures.

GOLD coated with a sulphide film is largely protected from the solvent action of cyanide. Where a 1% solution of pure cyanide dissolved a given weight of gold in ten minutes, the addition of 1-100,000 part of sulphur (as a sulphide) to the 1% solution of cyanide, caused it to require two hours to dissolve the same weight of gold.

TO CALCULATE the speed of a pulley, knowing the diameter of the driven, multiply the diameter of the driver by the number of revolutions and divide the product by the diameter of the driven; the quotient will be the number of revolutions of the driven, e. g.: 24 in. diam. of driver × 150, number of revolutions,=3600 ÷ 12 in. diam. of driven=300.

JOPLIN, Mo., ore averages 15% zinc and 4% lead. The average cost of mining and hand jigging free ore that needs no crushing is 81.1 cents per ton. Thirty tons of ore make 4.5 tons zinc contentrates and 1.2 tons lead, making the cost per ton of clean ore $4.27. The present price of standard 60% zinc ore at the mine is $35 per ton, lead ore $53 per ton.

THE influence of the mining industry is seen and felt in all branches of mechanic arts, and its impetus on the mechanical and engineering progress of the country is second to none in the development of the nation. To the mining industry is due in a great measure the present advancement and prosperity of this country in everything that inures to national wealth.

TO FIND the number of board feet in a stick of timber 4x4 at one end and 8x8 at the other—24 feet long—add the areas of the two ends to four times the area of the center section and multiply by one-sixth of the length; or, multiply the areas of the ends and extract the square root: to this add the areas of the two ends and multiply by one-third of the length. The answer by either process is 74⅔ feet.

DURING the sixty days ending Dec. 5th, there were received at the business office of this paper the names of 353 new subscribers, west of the Mississippi river. Of these, 73 were from Colorado, 41 from Arizona, 39 from California, 31 from Montana, 29 Utah, 27 Idaho, 24 Oregon, 19 Washington, 18 Mexico, 17 Nevada, 14 British Columbia, 10 South Dakota, 6 China, 4 Japan, 1 Honolulu.

THE relative merits of stamps and other devices for crushing ore have been freely and fully discussed herein. Each system has its zealous adherents, and each has just claim to preference in individual cases. The general tendency is to supersede stamps, yet in steadiness, capacity and general economy those old stand-bys have a practical record that will not speedily allow them to be eliminated from universal use.

WHILE endeavor is made in this column to correctly reply to inquiries for specific and technical information, it is not a matter of "questions answered while you wait," and at times an interval must necessarily elapse between the receipt of the inquiry and the appearance herein of the desired information. It may also be noted that it is much easier to ask questions involving correct information than to answer them.

AN agent, trustee or other person having confidential relations with the original locator of a mining claim will not be permitted to relocate such claim and secure to themselves advantages flowing from a breach of trust obligations. Where, however, such confidential or fiduciary relationship has terminated, the rule no longer applies and a subsequent location by such former agent or trustee has been upheld by the courts.

A WIDE-AWAKE Arizona prospector recently announced the discovery of rich platinum deposits on a high plateau near Cataract canyon, in Coconino county, and has some of the best claims in the district. As a result, a stampede set in and a village of tents, called Platville, has been established. Conspicuous among the business establishments is a boarding house, owned by the discoverer of the mines, who knows how to embrace an opportunity. The whole thing is deemed a fraud.

CASSEL'S method of chlorination by electrolysis employs, for dissolving the gold from roasted ores, chlorine produced by the electrolysis of a solution of common salt, adding caustic lime to neutralize the objectionable hydrochloric acid produced by secondary reaction. The same apparatus serves for the generation of the chlorine, the chlorination or conversion of the gold into chloride, and the precipitation of the gold in the metallic form. It consists of a large barrel, capable of being revolved on a horizontal axis, which is hollow and serves as the cathode for the collection of the gold as precipitated. The anodes are a number of plates of retort carbon. There is the customary manhole in the barrel for charging and discharging. The axle is covered with a filter of asbestos cloth, and inside is an archimedean screw, working in properly packed boxes, to remove the gold as formed and convey it to the boxes at either end, exteriorly to the barrel. The charge is about two tons of roasted ore, and sufficient solution of salt to make the pulp fluid, together with the necessary quantity of quicklime. The barrel is given eight or ten revolutions per minute, and the current from the dynamo turned on.

OZONE has been recently liquefied by H. G. O'Neill of Philadelphia, Pa. It is heavier than liquid air, is an antiseptic and anæsthetic and is expected to supplant ether, cocaine and chloroform. Its discoverer prepares it by first passing a supply of pure oxygen through tubes immersed in liquefied air, reducing its temperature, then subjecting it to a heavy pressure in specially devised chambers and passing discharges of electricity at high voltage through it, thus producing ozone. This mixture is then compressed gradually in a series of cylinders immersed in liquefied air; and by combining a very high pressure with an intense cold, liquefied ozone is produced.

THE California mining law passed in '97 required that within twenty days of the location of a claim a preliminary notice of location should be filed with the County Recorder, and that within sixty days of discovery and date of location $50 worth of work must be performed in developing the discovery, and must also file with the County Recorder a certificate of location, etc. This law was in full force and effect in '98, but failure to comply with it does not work a forfeiture. The Supreme Court of California has ruled that noncompliance with local law does not work forfeiture unless the law or rule provides that failure to comply shall work a forfeiture, and this the California State law does not do. Bell vs. Bed Rock T. & M. Co., 36 Cal. 214.

NO CLAIM is made in these answers for absolute accuracy or perfect expression of technical fact, but it is believed that the statements weekly made herein in answer to many questions are as nearly correct as any similar collection can be. That, at least, is the intent, and that these condensed answers to current queries are received with favor is manifest by the constant stream of inquiries and the equally constant commendation from so many readers. Of course, it is easy to decry and detract; much easier than to essay the task itself, the critic always having a lighter duty than the one whose effort is criticised. Usually, however, the carping critic carefully refrains from exercising other than his iconoclastic faculties.

THE twelfth census of the United States in 1900 officially embraces all manner of statistics relating to all industries—except mining. Everything in connection with all trades has official, preliminary statistical notice — except mining; all classes and conditions of men are to be noted—except miners. The great basic industry of the nation, the one business that underlies all else, and on which all else depends, is not represented by any official notification of the intents or purposes of the twelfth census in the closing year of the century. The insane, the deaf, the dumb are worthy of note, but there is no more mention of the mineral industry in the bill providing for the taking of the twelfth census than if such an industry did not exist.

MOST of the veins of Gilpin county, Colorado, have two distinct zones of ore, one, the heavy sulphide concentrating or shipping ore, the other the milling rock. Gouges are not uncommon, but not always present. The smelting ore is chiefly pyrite, with some copper sulphide. The milling ore is feldspathic material, with some quartz. In these mines the value rather than the mineral composition determines the smelting ores. In these ores calcite is of rare occurrence, which has been explained on the hypothesis that the country rocks contain no lime-bearing feldspars. In the veins occurring in the granite areas of California calcite is a common constituent of vein filling, and also in the greentone formations, each having lime-bearing feldspars in abundance.

THE diamond mines of South Africa at Kimberly, which were originally worked by an extensive open cut system, which became eventually very expensive and dangerous, are now worked by levels through vertical shafts sunk back from the rim of the pits. The system of mining is similar in some respects to that at drift mines in California. But one level is worked at a time, which, when worked out, is abandoned and another level is opened. The De Beers mine is opening the 1400 level. The main levels are 200 feet apart. As the workings proceed downward the excavation fills from the surface by caving of the rim of the crater-like excavation. At the Kimberly mine the skip is filled, hoisted 1520 feet and dumped in forty-five seconds. The skip contains four tons of diamond-bearing earth.

BY "slip of the wheel" on a steamship is meant the difference between the actual distance run and the distance that would have been covered had the steamship's propeller acted upon a solid substance instead of a fluid. The expression may be understood as the lost motion of the propeller. It is usual to allow a certain number of revolutions to the propeller or paddles to the mile, and at the end of a stated time the estimated distance run by the ship, according to the number of turns made, is compared with the actual distance run by the ship according to observation of the heavenly bodies or by the patent log, and the difference between these two records is expressed as a percentum, and entered in the log book as "slip of wheel." Retardation by reason of head winds and high seas comes under the head of slip. Suppose the distance run according to revolutions is 100 miles, and the actual distance run is 75 miles, the slip of wheel is 25%.

THERE is a limit to the depth of possible ore formations, as that formation is dependent on the presence of water. As one sinks into the earth, temperature increases 1° F. for 48 feet descent. At this rate, the critical point of water would be reached at 34,704 feet, or 6½ miles deep. Where the temperature is that of the critical point, 773° F., water can not exist as a liquid, no matter how great the pressure, but becomes disassociated into its gaseous elements. The thermometrical gradient becomes more rapid at depths beyond these reached by human observation, because of decreased conductivity in rock. It may be expected, therefore, that the circulation of water ceases at 20,0000 feet. But at maximum depth maximum pressure and temperature obtains. It must be a horizon of solution. Precipitation would hardly begin till a lowering of temperature and lessening of pressure permitted. Deposition of ore is the direct result of precipitation, hence actual ore formation is limited to 15,000 feet.

The Cripple Creek Gold Field.*

Written by T. A. RICKARD, State Geologist of Colorado.

In 1892, when Cripple Creek began to be talked about as a new locality where important discoveries of gold had been made, the name seemed only provocative of derision. It is said to have originated from the fact that at a certain point on the course of the little stream there was a morass in which straying cattle wandered and, in their efforts to extricate themselves, were occasionally lamed. However, the name needs no apology to-day, the magic baptism of golden discovery has made it sound as alliterative and impressive as the most exacting historian could demand.

Physical Features of the District.—The gold-bearing portion of the district covers an area four miles long by three miles wide, occupying a group of hills which rise from 300 to 1000 feet above the general surface, and have a general altitude of 10,500 to 11,000 feet above the sea. The drainage of the region flows into the Arkansas river, whose gateway into the plains is at Canyon City. The general slope is southward, and the sunny aspect incident to this configuration of the surface has caused the hillsides to be clad with grass, and rendered them, at one time, despite the high altitude, a good pasturage for cattle.

The physical condition of the surface had much to do with the chequered history of the district. Owing to the southern exposure and the comparative absence of a protecting growth of trees, the rocks, which mostly protect a fissile structure, have been shattered by frost so as to overspread the solid formation with a thickness of debris to which the tufted grass has given a further covering. Water, owing to its expansion between 4° C. and the freezing point, is a ceaselessly destructive agent. When it penetrates the cracks and crannies of the rocks it serves as a wedge, shattering their stony substance with a resistless power. The heat of day and the cold of night, the warmth of summer and the snows of winter, alike aid this disintegrating process. A high altitude and a south slope afford the conditions most favorable to such action. Thus it came about that the district of Cripple Creek is largely covered with shattered rock fragments which, if not in place, are not far from their original position, having slid down the hill slope in obedience to the laws of gravity. This shattering of the rock surface has caused one important and, in Cripple Creek's case, far-reaching result. There are no outcrops. Ordinarily, veins of gold ore stand above the surface with that boldness which caused the Australian miner to call them "reefs," and the Californian to call them "ledges." The ore is essentially mineralized and enriched rock, comparatively devoid of the quartz composing the typical lodes of other districts in America or Australia, and consequently it shares with the rock the tendency to undergo easy shattering. Solid veinstone, therefore, rarely survives amid the general disintegration, the outcrop of the Independence being a very notable exception.

The first discoveries in mining are usually due to the finding of outcrops; in the absence of them, deep explorations are rarely undertaken. Deep ravines often afford good natural sections of the rock formation. The Cripple Creek district was as deficient of the one feature as the other. The absence of steep declivities and consequent rock faces was characteristic of the pastoral landscape, and the angular debris covering the rounded hillsides made digging difficult. For these reasons, although the district was traversed by many thousands of prospectors at successive epochs, the existence of rich lodes was not surmised until a very recent date, and many experienced miners failed of success at first because they encountered conditions unfamiliar to them. Among the early arrivals, in '91 and '92, were miners from Gilpin, Leadville and Aspen, men of knowledge in their own habitat, but unable to understand the peculiar vein structure which they saw at Cripple Creek. It was the adverse opinion of these men, rather than the views of geologists or scientific observers, which injured the reputation of the gold field in the beginning of its development.

The Geology of the Gold Field.—The intimate relationship between geological structure and ore occurrence has nowhere been more forcibly emphasized than in Colorado. This is largely due to the labors of the United States Geological Survey, whose monographs on Leadville and Cripple Creek have been of inestimable assistance to the mining industry.

The dissemination of accurate knowledge regarding the geology of mining districts has been aided by the increasing simplicity and clearness of the language employed to convey it. The application of science to commerce, of geology to the industry of mining, has led to the recognition of the fact that to talk to business men in a hybrid Greek-Latin jargon is only an impertinence. If mining be not a business, it is a vain delusion. The language of technical science, when it bears upon business, must be made intelligible to business men, otherwise it will remain a mere abracadabra of speech.

The mines of Cripple Creek are situated in a complex of volcanic rocks, occurring amid the mass of granite whose culminating point is Pike's Peak. These volcanic rocks found a passage through the underlying granite in the comparatively recent period known to science as the Miocene, an early part of the last of the three great subdivisions of geological time. The granite is the basal rock of the region and at one time probably formed the floor of the ancient seas which received the sediments now composing the sandstones and limestones flanking the Front range. The granite is of a particular type, known, because of its prevalence in this locality, as the Pike's Peak granite. It is coarsely crystalline and its three ingredients, the minerals quartz, mica and feldspar, are easily distinguishable by the unaided eye. A beautiful red tint, mainly due to the color of the feldspar, characterizes it and renders it recognizable by the least observant.

Long subsequent to the formation of the granite and the sedimentry rocks which were laid down upon it, there began an elevatory movement. Accompanying this movement there occurred a general fracturing of the rocks thus affected, so as to permit volcanic matter to force a way upward. The volcanic rock thus brought to the surface of the granite slowly filled the hollows of its uneven surface, and spread over a large area since then diminished by the forces of atmospheric erosion, which, during the long period of time separating the Miocene from the present day, have sculptured the hills and valleys of the district.

A glance at the colored geological map of the gold field exhibits a great variety of volcanic rocks. The principal of these is andesite breccia, a name derived from Andes, the mountain range where this rock is specially prevalent. The very nature of the breccia suggests the violence of the volcanic action which brought it to the surface of the granite. The miners call the breccia "porphyry" from its apparent resemblance to the rocks of that class with which they were previously familiar in the Leadville and in the Gilpin county mines. The porphyry of Leadville is quartz-felsite, that of Gilpin is quartz-andesite. Porphyry refers to the structure rather than to the composition of a rock, so that there is "granite-porphyry," "diorite-porphyry," "andesite-porphyry," etc., the term being applied to rock of igneous origin in which particular minerals are distinguishable amid the ground mass of the rock so as to give it a speckled appearance. The Cripple Creek breccia has this appearance, but it is due to the fact that it is made up of a heterogeneous mass of rock particles of every size, from the most minute powder to fragments as large as a man's head. These consist mainly of andesite, but the other rocks are included, especially near the edges of the volcanic vent. Some of this material is volcanic dust, called tuff, which, when consolidated under pressure and cemented by siliceous waters, becomes compacted into a dense hard substance difficult to distinguish from a true crystalline rock; so that it is not to be wondered that the miners often label it with an incorrect name.

The breccia lies in the uneven hollows of the ancient surface of the granite, and probably fills a large part of the vent through which it was ejected. The thickness of the breccia has not been proved, nor has the exact position of the vent been discovered. The mine workings have shown the thickness of the breccia to be over a thousand feet in several places; but as these are for the most part near the edge of the mass there is every probability that the maximum depth of this formation is several times one thousand feet in the vicinity of the point of extrusion.

The accompanying sketch, Fig. 1, of the Cripple Creek volcano is largely diagrammatic, but it will serve to convey a general idea of the geological structure of the district.

The breccia is penetrated and traversed by later volcanic rocks, of which phonolite is the most important in its relation to the occurrence of ore. The phonolite occurs for the most part in dikes, which traverse the older formations, the granite and the breccia, in various directions, and are probably united, at depths far beyond the reach of human exploration, to larger masses of rock having a similar composition.

These dykes follow such lines of weakness in the older rocks as were developed into fractures during those periods when the rocks underwent strains, the latter being considered to be the result of the slow wrinkling of the earth's crust due to its readjustment over a cooling and shrinking interior. The phonolite rose in a mobile, if not molten, condition, through the fractures thus formed after the manner of water rising through the cracks in the overlying ice. The structural conditions thus created gave a direction to the subsequent circulation of underground waters. The deposition of ore is the result of such circulation, the mineral-bearing solutions being the vehicle by which the metals are leached out of the rocks and laid down elsewhere in such a concentrated form and within such a distance of the surface as to render them valuable to man. The place of origin is surmised, but vaguely, as being deeper than our deepest mines. Lines of weakness, healed and strengthened by the cementing effects of hot igneous rock, in the form of dykes, afford new lines of lesser resistance, parallel to the old ones and along the contact of the two rocks of

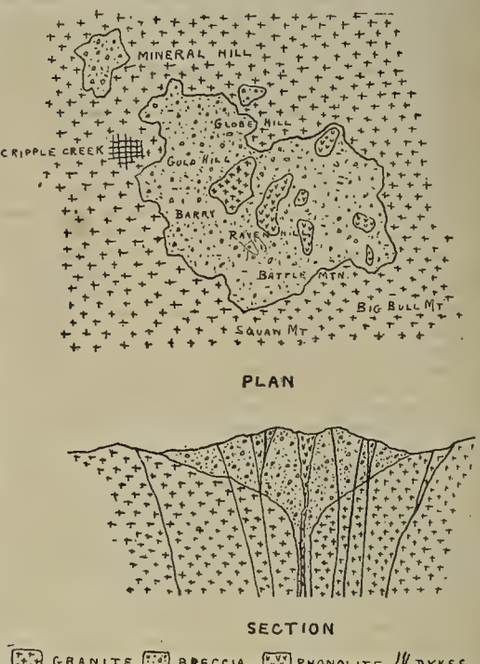

Fig. 1.—Plan and Section Showing Geology of Cripple Creek.

unlike hardness and texture. For this reason ore-bearing veins so often accompany dykes. They do so at Cripple Creek.

The mines of Cripple Creek afford excellent illustrations of the teachings of modern geology, and emphasize the incorrectness of the hasty generalizations of Sandberger and others before him. It is, of course, foolish to deride even theories which are now laid on the shelf, after they have served the purpose of quickening the researches of scientific enquirers. A working theory is needed in order to give some sort of direction to observation, because without an intelligent idea of what may be the possible fact one certainly will be unlikely to discover the real one. During later years the lateral secretion theory of Sandberger became accepted by certain distinguished geologists, and was as vigorously combated by others, notably Posepny, with the result that a great impetus was given to observation, and a large mass of new facts has been collected, bringing the scientific explanations of ore occurrence another step nearer the knowledge of things as they are. The unthinking sneer at the faltering steps of science, and the working miner is apt to belittle the aid which geology gives him. Each intelligent observation is one step nearer the attainment of truth, and those who direct the working of mines will get more aid from geology when they contribute the necessary data without which the occurrence of ore will remain merely a maze of tangled phenomena.

Nature does not recognize the definitions of the technical dictionary and in mining practice it has been found that regularity of structure is the exception rather than the rule. The geologist of fifty years ago, when the science was more the product of the library and the laboratory than of actual observation underground, conceived the ore as having filled gaping fissures in the rock, comparable to the crevasses of a glacier, and when he had noted the dissimilarity between the ore and the encasing rock, he imagined the former to have been due to an upwelling of molten metallic matter. The ideas of the present day are still slightly tainted by the imaginations of the past and the terms of an obsolete philosophy continue to cling to our nomenclature.

Modern investigations, based on accurate chemical knowledge, as well as geological observation, have all gone to prove that gold ores are not the product of direct volcanic action, but that they have been conveyed to the place where the miner finds them through the medium of water, the metals having been dissolved, in various chemical combinations, by underground solutions, and precipitated along those fractures in the rocks which have been first lines of least resistance, and then lines of maximum circulation.

In a railway cutting between the towns of Cripple Creek and Anaconda, there is a bit of nature's testimony which will be of service in getting a clear idea of the essential characteristics of gold-bearing veins as compared with dykes of volcanic rock. The accompanying drawings will help the description. In Fig. 2 there is afforded an illustration of simple dyke structure. The dyke in this case is composed of basalt; it is from 9 to 15 inches in width, and can

*Condensed from a paper recently read before the Institute of Mining and Metallurgy.

be traced as an irregular dark band traversing the coarse-grained pink granite. The dyke is well defined, exhibiting clean-cut lines of demarcation from the enclosing granite, and it is evident from the contour of the walls that it occupies a fault fissure. The outline of the east wall corresponds ex-

Fig. 2.—A Dyke in Granite.

actly to that of the western one, the movement of the latter having been upward, causing a displacement equal to about 14 inches. It is a clean-cut fissure of granite, filled with foreign material, a basic volcanic rock, which probably welled upward in a mobile condition, filling the fissure as it was formed, so as at no time to permit of a vacuity. Compare

Fig. 3.—Granite Altered to Ore.

this with Fig. 3, which is a sketch of a gold-bearing vein, a few yards from the dyke illustrated in Fig. 2. The country is the same, viz., granite, but in this instance the vein filling is not foreign matter, but essentially rock in place; it is granite, altered, indeed, but easily recognizable, in spite of the kaolinization of the feldspar, and the partial removal of the mica. There are no clearly defined boundaries between the decomposed vein matter and the enclosing country, nor is there any evidence of faulting. The lines of fracture shown in the granite are the joints of that rock, and those which are observable in the vein itself are not continuous, but rather a closely knit series of little breaks, which have afforded a passage for a liquid more subtle than basalt. The vein occupies a line of maximum porosity along which water has found a way, decomposing the soluble ingredients of the rock and depositing a minute quantity of gold insufficient to make the decomposed granite of the vein differ essentially from the outer country, but rendering one gold-bearing ore and leaving the other barren rock.

The faulting along the fissure followed by the dyke is easily seen, but no evidences of such movement can be discerned along the seam of altered granite, which forms the gold vein. Nevertheless there must have been some movement, however slight, because a crack or break is not made evident, can be considered only as latent, until the two faces of it are caused, by that very shifting, so to disagree as to produce the irregularities which, when linked together, form the visible line of fracture. Even the joints in the solid granite require such an explanation, and however insignificant the shifting may be, it marks the adjustment of the rock to the effects of stresses, traceable in this case to the volcanic energies which extruded the large masses of breccia forming the characteristic feature of the geology of Cripple Creek.

(*To be Continued.*)

The Upper Coffee Creek Mining District.

Written for the MINING AND SCIENTIFIC PRESS by OSCAR H. HERSHEY.

One of the most promising undeveloped mining districts in the State of California is that of the upper Coffee creek region in Trinity and Siskiyou counties. It is situated in the western part of the Sierra Costa mountains, of the Klamath system of northwestern California. Occupying a north-south belt along Hardscrabble, Hickory, Union and Pine creeks, tributaries of Coffee creek, thence southward, following the divide between Swift creek and the south fork of Salmon river, the mineral belt has been traced throughout a distance exceeding ten miles, with a width of one-half mile to one mile. The country is high and broken, with bare, rocky peaks and deep, narrow gulches, except in the heads of the glaciated valleys, which are broad and open.

It has been only half prospected. The mines already opened date mainly from the "Coffee creek boom" of two years ago, which, although based on misrepresentation, has directly resulted in the discovery of this district.

The formations represented are mainly serpentine, mica and hornblende schists, which are cut by huge intrusions of granite and granodiorite, and by dykes of a great diversity of igneous or trappean rocks, including granite-porphyry, quartz-porphyry, diorite-porpyrite, and diabase. The metamorphic strata outcrop in long, narrow belts trending nearly due north to south. Their normal dip is westward, but this is interrupted by two great faults or breaks in the strata, situated about one-half mile apart, and traceable for a distance of ten miles. In both cases the upthrow is on the east, and the average dislocation is between 1000 and 2000 feet. The block of strata (mainly mica and hornblende schists) between them has been compressed and tilted to the eastward so as to reverse the dip. The minerel belt lies mainly between and including these dominant faults of the district.

There is here a great diversity of gold-bearing deposits. Some mines yield an abundance of free gold in white ribbon quartz, others in bluish-gray granular quartz, while some of the best present no regular quartz veins, but have an abundance of free gold and sulphurets in broad strips of talc and serpentine schist, and in belts of crushed hornblende schist. A certain system of dykes of white quartz-porphyry in places carry enough gold in seams and manganese-filled cavities to make them milling propositions, while gouges along the walls yield ore whose tenor is $4000 to $6000 per ton. There are places on the 300-foot granite-porphyry dyke which follows the western of the two dominant faults where prospecting has demonstrated the presence of considerable free gold within the body of the porphyry, and schistose bands along its walls are the site of some of the best mines.

The question is universally asked of all new districts, "Will the mines go down?" It is the purpose of the writer to argue that those of the upper Coffee creek district are of a permanent character.

1. All the mines and "prospects" are connected with faults or dislocations of the strata. Even the belts of talc schists are merely strips of the massive serpentine given a schistose structure by shearing and metasomatic action. The breaks in the strata always occur along pre-existing lines of weakness, which often happen to be the walls of dykes or the contact between dissimilar formations; hence the close relation between the porphyry series and the gold-bearing veins.

2. The planes of the faults are nearly vertical, and they must go down to a great depth—at least several thousand feet. In the case of those mines situated at the contact between a dyke of igneous rock and the metamorphic series, it is beyond question that this contact, at least, will go down many thousands of feet. The problem narrows itself to one of determining whether the pay shoots go down also, or are confined to certain levels along the faulted belts.

3. The presence of gold in certain systems of dyke rocks, notably in that of quartz-porphyry, suggests that the origin of the auriferous minerals was in the dykes of melted material injected into fissures. However, the weight of evidence indicates that the gold was deposited from hot alkaline solutions coming up from great depth along the dislocations or faulted fissures in the rocks. It is certain that the country rock of the metamorphic series is practically barren of gold except where crushed, through faulting, and locally mineralized from below. Hence the gold-bearing solutions must have traversed the faulted belts from profound depths, and the question of the permanency of the mines is narrowed to that of whether deposition occurred at one or many levels.

4. The occurrence of rich ore in the upper Coffee creek district is not confined to one level, but ranges in altitude from 4500 feet to 7500 feet above the sea. Even on a single claim the ore bodies may be traced on the mountain slopes through a vertical height of 500 feet. (The present valleys, being deep ditches excavated by the streams and glaciers in the rocky strata since the mineral veins were formed, are equivalent to shafts sunk on pay shoots in a more level country.)

In short, all the evidence indicates that the ore bodies of this district are of great vertical extent, and in all probability descend below a workable depth. The geological conditions are similar to those in the Grass Valley and Nevada City districts of the Sierra Nevada region.

The future of this district is bright. At present it is in an undeveloped condition, and the attention of capitalists has not yet been attracted toward it. It is within eight miles of a wagon road up Coffee creek to the Nash mine store, and all supplies have to be carried in by pack train over a rough trail. There is not a mill in the district, and most of the ore worked is treated in arrastras. The past season the owner of the Dorleska mine was sacking ore for shipment to Denver, Colo., containing free gold and a sulpho-telluride of lead and gold (nagyagite) up to a value of $5000 per ton. Such rich ore as this is always of very localized development. It is the low-grade ores that make the great mines. The upper Coffee creek region contains great bodies of $10 to $15 rock, some in free gold, and all cheaply workable by the cyanide process. At present the low-grade propositions are ignored, as all the prospectors are searching for rich streaks, from which they can gain their livelihood with the pick, shovel and pan.

This early stage of the district's history is destined soon to end. There are known to be a large number of "traces" (free gold in the soil on the mountain slopes) along the mineral belt, which have not yet been panned to their sources in the veins. A few more summers' prospecting will greatly increase the number of mines in course of exploitation. Then capital will find its way into the region and the transportation problem be solved by the construction of good mountain roads, and another rich camp be added to the list of California mining communities. The great bodies of low-grade ore will be economically worked by power furnished by electrical plants established at such points as the falls on the south fork of Salmon river and a series of cascades midway of the course of Swift creek.

Bragdon, Cal., Dec. 9th, '99.

The World's Pig Iron and Steel.

In the following table is given the production of pig iron and steel in all countries in '98. English tons of 2240 pounds are used for Great Britain, Canada, the United States and "other countries," and metric tons of 2204 pounds for all other countries, metric tons being used as the equivalent of English tons in ascertaining the total production for all countries. The statistics of steel production for the United States, Great Britain, France, Belgium, Austria-Hungary, Sweden, Spain and Canada embrace ingots and direct castings, but for Germany and Luxembourg, Russia and Finland and Italy complete ingot statistics are not available, and the statistics for finished steel have therefore been used:

Countries.	*Pig iron, Tons.*	*Steel, Tons.*
United States	11,773,934	8,932,857
Great Britain	8,809,719	4,665,986
Germany and Luxembourg	7,232,988	5,779,570
France	2,534,427	1,473,100
Belgium	979,101	653,130
Austria and Hungary	1,308,423	880,696
Russia and Finland	2,222,469	1,145,758
Sweden	531,766	265,121
Spain	261,799	213,015
Italy	8,393	63,940
Canada	68,755	21,540
Other countries (about)	125,226	15,287
Totals	35,657,000	24,110,000

Minerals in the Philippines.

In a report to the Interior Department on the geology of the Philippine islands, Geo. F. Becker of the U. S. Geological Survey gives some interesting information regarding the mineral resources of the group. Mr. Becker says, while gold exists in both Luzon and Mindinao, it is comparable rather to that of the Carolinas and Virginia than to the Western gold fields of the United States, and a rush to the Philippine fields, he predicts, would result in disappointment. The report says: "The copper deposits of Lepanto seem rich and extensive, but very expensive roads will be needed to render them available. The high quality of some of the iron ores of Luzon is beyond question, but the lignite of the islands is not adapted to iron smelting. The so-called coal is a good lignite. Its heating effect is from two-thirds to three-quarters of that of the best steaming coal. There are great quantities of this fuel, and much of it will probably be delivered at a profit on vessels at $2 50 Mexican per ton."

The Copper Belt of Shasta County, Cal.

The extensive operations of the Mountain Copper Co. in Shasta county, Cal., has drawn attention to the copper belt of that section, which lies in a crescent-shaped area, with the Iron Mountain group at its southwestern limb and Furnaceville near its southeastern end, Copper City, Bully hill, the Afterthought mine, the Balaklala group and others of less importance lying at intermediate points along the arc of the circle.

The Afterthought mines occur near the contact of slate and porphyry. The ores contain copper, zinc, gold and silver. The deposits near Copper City are in feldspar porphyry, which occurs in large massive intrusions. The ore is also of irregular occurrence in the porphyry. This district properly includes the Bully hill properties. In these latter the ore is gray copper with antimony, zincblende, pyrite and galena, with gold and silver. A heavy red gossan is characteristic of these mines. In their early history the Excelsior mine produced many handsome specimens of native silver from near the surface. The gangue minerals are chiefly heavy spar and calcite, quartz being of rare occurrence.

AN OUTCROP OF COPPER ORE.

Bully hill, two miles north of Copper City, is a mineralized feldspar porphyry, the red gossan being a marked feature of the landscape. Early placer miners took considerable gold from the gulches heading in these deposits. J. R. De Lamar is developing this group.

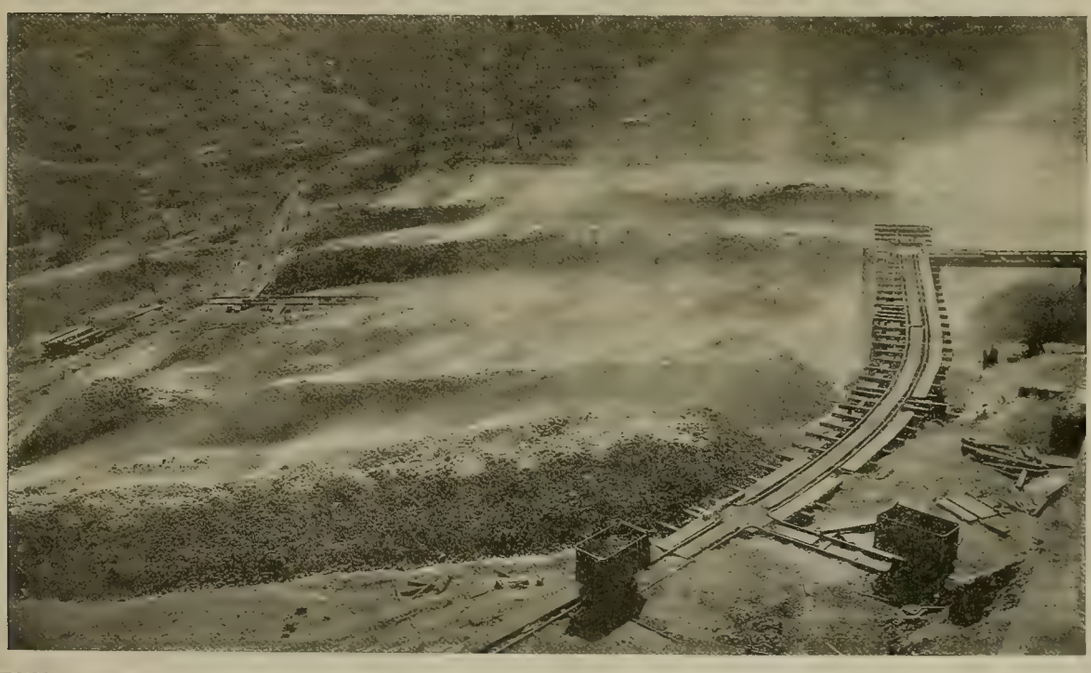
The largest and most extensively developed deposits in the county are those of the Mountain Copper Co. at Iron mountain, near Keswick, between Boulder and Slick Rock creeks.

Near the latter creek is an outcrop of gossan 300 feet in width. The principal ore bodies of this group occur as large lenses or masses, which near the surface are oxidized, forming the familiar gossan, and in depth pass into the normal sulphide ores. It is seldom the gossan extends below 100 feet from the surface, that being the depth to which meteoric agencies have penetrated.

A large deposit of iron ore on what was formerly the Lost Confidence mine is separated from two silver-bearing veins by 300 feet of porphyry. The two silver veins are divided by a dyke of quartz porphyry from 1 to 3 feet in width. The foot wall vein is from 10 to 30 feet in thickness and contains large amounts of copper sulphide, which carry 20% to 30% copper and ten to thirty ounces silver per ton. The hanging wall vein consists almost wholly of pyrite, with little copper. It is 80 to 150 feet in width. It also contains silver and a small amount of gold.

The great ore body from which the Mountain Copper Co. is now drawing its supply has approximately a width of 300 feet, a length of 800 feet, and is about 250 feet in depth. This mass is the lower portion of what was evidently at one time a huge lens, the upper portion of which has been removed by erosion. This ore shoot is estimated to contain more than 1,500,000 tons.

The first attempts to reduce the sulphide ores by pyritic smelting was a failure, and preliminary roasting with subsequent smelting in a cupola furnace was then tried with more satisfactory results. The stall roasting resulted in concentrating such large volumes of sulphurous gases at one place that it was abandoned for heap roasting at a large number of places along the railroad from the mines to the smelters at Keswick. These heaps are formed about piles of wood, provision being made for draft. The wood is fired and the sulphur in the ore igniting it continues to burn until the sulphur has been burned out, which requires usually about two months. The ore is then reloaded upon the cars and taken to the smelters, where it is charged with the necessary fluxes to the furnaces, which have a daily capacity of about 200 tons.



An official report states that during 1898 there were mined 221,895 tons of ore, containing an average of 8.42% copper. Of this 168,541 tons were smelted, resulting in 10,721 tons of metallic copper. It is said the net profit on this output was $815,000.

The company buys ore from the mines of the surrounding districts and has proven an important factor in the general development of the mineral resources of the county, affording an immediate and convenient market for the high-grade base ores which would otherwise remain unworked. As has been pointed out above, the ores of the Mountain Copper Co. contain but a small amount of silica—insufficient to make them self-fluxing—and the purchase of the siliceous ores from other mines of the district is of advantage to the Copper Co. as well as to the mine owners.

In the Backbone district, along Squaw creek, the same porphyry is found, and in it the copper-iron ore bodies. The Squaw creek mines are located in about the center of this porphyry belt and contain gold instead of silver. Moreover, they are defined veins, and not irregular deposits, like those previously referred to. These Squaw creek mines are found in an acid quartz-porphyry, and, though often called quartzite, they are of eruptive origin.

In the Balaklala mines the surface of the deposits is oxidized, containing gold and silver, and is low in copper; but beneath are found large masses of copper-iron sulphide ore.

There are in the copper district large undeveloped deposits, the extent and value of which cannot be determined without exploration, and as the fact has already been established that the heavy surface gossans do not always cover the richest copper deposits, and that rich copper shoots are found where no surface indication of their existence appears, the possibilities of the district may be considered as unknown in the present stage of development. The use of the diamond drill for prospecting in a region of this character is to be highly recommended, as the ore deposits are large, though erratic, and much valuable information could be gained by their use at a minimum cost. The diamond drill has been employed to a limited extent in the district with satisfactory results.

HEAP ROASTING, IRON MOUNTAIN SMELTERS, KESWICK, CAL.

Report of United States Geological Survey.

TO THE EDITOR:—Part II of the nineteenth annual report of the U. S. Geological Survey contains five papers. The first, Physiography of the Chattanooga District, in Tennessee, Georgia and Alabama, by C. W. Hayes, sets forth the results of a study of a region in which several distinct types of land surface are characteristically developed. It traces the process of drainage development and the origin of the present land forms upon rocks of diverse erodibility and diverse structure.

The second, Principles and Conditions of the Movements of Ground Waters, by F. H. King, contends that the water which occupies the interior of the earth's crust is, like that of the ocean and of the atmosphere, constantly in motion. These motions are at once numerous, extended and very complex, and are brought together and discussed under three categories—gravitational, thermal and capillary.

The third, Theoretical Investigation of the Motion of Ground Waters, by C. S. Slichter, relates to an investigation of the general problem of the flow of water through porous soils or rock.

The fourth is entitled Geology of the Richmond Basin, Virginia, by N. S. Shaler and J. B. Woodworth. The Richmond area is important from the economic as well as the scientific point of view. It contains the only freely burnable coal lying immediately adjacent to tide water in the eastern portion of the United States.

The final paper, The Cretaceous Formation of the Black Hills as Indicated by Fossil Plants, by L. F. Ward, with the collaboration of W. P. Jenney, W. H. Fontaine and F. H. Knowlton, presents a brief historical review of the investigations of earlier explorers, followed by specific chapters on the Minnekahta, Blackhawk and Hay Creek regions, general observations on the Cretaceous flora, fossil cycadean trunks, fossil forests, lower Cretaceous plants other than cycadean trunks and silicified wood, and the flora of the Dakota group proper.

CHAS. D. WALCOTT, Director.

Next Year's Ore Rates.

Blast furnace operators have been notified by the Bessemer Ore Producers' Association, which held a meeting in Cleveland, of an advance in the price of old range iron ores for the season of 1900, says the *American Manufacturer*. The rate has been raised from $2.90 to $5.50 per ton, a figure which was hardly expected. Many users thought the price would be placed at $4.50 or $5.

The Mesaba ores, which are not controlled by any association, have been raised in sympathy with the old range ores, the rate now being quoted at $4.25, an advance of $1.25. Heavy purchases of Mesaba ores were made by the Pittsburg and Valley furnacemen before the high notch was reached in prices.

It is not thought that the sharp increase in rates will affect the demand, and many operators are of the belief that every ton of ore mined under present plans will readily find a market.

Phenomena Attending the Accumulations of Bitumen.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER, State Mineralogist of California.

Serpentine Rocks.—On the periphery of the jaspers, and between the jaspers and unaltered rocks, are serpentime rocks; also resting upon the jaspers are isolated bodies of serpentine rocks. All gradations from shale to serpentine rocks can be seen. Shales having a slight bluish green tint can be obtained; also pieces of the shale partly converted to serpentine rock, one part being serpentinous and the other shale. The serpentine rock lying on the surface of the jaspers would have a tendency to prove that the said serpentine is not eruptive, but metamorphic. Serpentine is seen in every stage of passage from argillaceous sandstone, shale and jasper to perfect serpentine itself.

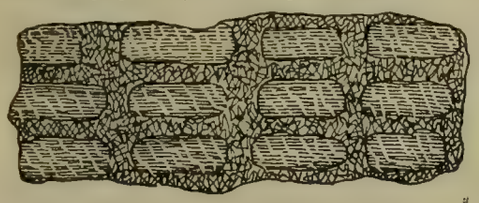


FIG. 7.—ALTERATION OF JASPER TO SERPENTINE.

The spaces between the irregular but somewhat cubical fragments of jasper which are arranged in rows after being converted to jasper from shales are filled with serpentine rock, and these fragments are frequently partly rounded by the alteration of the jaspers to serpentine rock. The lined portion of the figure indicates unaltered jasper and the remainder serpentine rock. The rounding of the cubiform fragments of jasper represents an incipient decomposition of the same.

The serpentine rock being next to the unaltered rocks which at one time was saturated with mineral water, the said unaltered rocks would permit the circulation of water bearing these minerals. The decomposition of jasper and shale to serpentine rocks seems to be more the action of hydrothermal than dry heat.

In places the spaces between the frgments of shales and serpentine rocks are filled with quartz carrying a notable amount of copper pyrites and a small amount of gold and silver. By an examination of the sectional views and sketch it will be seen that the northern side of the metamorphic rocks cuts the strike of the unaltered rocks diagonally, and that on the south side they run parallel with the strata of the unaltered rocks, sandstone being in contact with the serpentinic rocks.

A sectional view shows that the unaltered rocks on the south are part of the same strata as the unaltered rocks lying on the north of the metamorphic rocks. The unconformity of the metamorphic rocks with the sandstones and shales on the north and their conformity with the sandstones and shales on the south, taken with other phenomena described in this article, clearly demonstrate the fact that these unaltered rocks were not deposited on the altered rocks after they were metamorphosed. The unaltered shale underlying a sandstone is of great thickness, whereas at a point a half a mile east of this sectional view the metamorphic rock is nearly in contact with the same sand stratum.

Northeast of the metamorphic rocks are alternating beds of shale and sandstones. The shales are highly silicated. Silica dissolved in hot waters slowly ascended through the unaltered rocks lying north of the metamorphic rocks. The metamorphic rocks acting as a dam for its retention, as these hot waters cooled they were incapable of holding the same amount of silica in solution as when hot; therefore silica was deposited in the interspaces of the porous rocks. When siliceous waters flow upwards through a formation the rocks are silicated, and when the water flowed or flows downward through a formation the rocks are leached.

There are several reasons why this occurs. When waters flow upwards their flow is generally very slow; when coming from the depth of the earth the waters are generally hot, cooling as they approach the surface, and as they cool silica is deposited.

Silica is soluble in cold water. Under pressure and heat the solvent power of water is greatly increased. Upon the relief of the pressure or the cooling of the hot silicated water silica is deposited. A solution of silicate of soda, when undisturbed for a year or more, will deposit silica; if frequently disturbed no such deposition takes place. The deposition of silica from such a solution is quickened by the presence of carbonic acid. Petrified wood is often found in rocks that are not silicated. This is owing to the fact that the capillary tubes in the wood are much smaller than the interspaces in the circumjacent rock. Water filters through the wood and these rocks more or less quickly in proportion to their permeability; consequently circulation of fluids is slower in the wood than in the adjoining rocks. (*To be Continued.*)

Prevention of Freezing in Compressed Air Pumps.

The odd appearance of some of the "Concentrates" on the third page is due to the fact that those "Concentrates" are mainly boiled-down answers to questions technical and otherwise. To print the questions and answers in full would transcend the limits of this paper; but, ordinarily, the inquirer can get from the answer a good deal of information, and the general reader can usually get a fair idea of the matter.

Occasionally, however, a question is received which does not admit of extreme condensation, as, for instance, the following:

"E. J. R.," writing from Utah, asks:

Is there anything in practical use among mine operators that prevents the freezing up of pumps operated by compressed air, where inadequate ventilation prevents the use of a reheater near enough to the passage to give it any practical value? In my case, air is carried through 3500 feet of a tunnel, then down a shaft 200 feet more to the pumps—station and sinking pump having to handle 300 gallons of water per minute, while the nearest surface connection for ventilation is 1500 feet back towards mouth of tunnel from the shaft station. Present trouble is through freezing of pumps, though we use three receivers—the last at the shaft station—to give us as nearly dry air as possible.

In the case specified any one of three methods may be successfully used: First, where compound pumps are used, a device, noted some time ago as furnished by E. A. Rix, 507 Market St., San Francisco, would obviate the difficulty. This apparatus reheats the compressed air, and, incidentally, increases the efficiency of the pump, besides preventing its freezing up; or, second, the main discharge pipe from the pump can be tapped with a quarter-inch pipe, which may be led to the final exhaust of the pump. The end of the quarter-inch pipe should be drawn down and closed, so that there is a hole one-sixteenth of an inch in diameter at the end. Introduce this jet into the exhaust of the pump as far as possible and let the water squirt freely therefrom. This is a sure cure and will always keep the exhaust passages at a temperature that will prevent the formation of ice, and is simple and inexpensive. The small amount of water which is lost by this jet amounts to nothing. Third, submerge the pump entirely in a tank of water.

Some Salaries in British Columbia.

The Rossland, B. C., *Miner* says that the highest paid man in the mining business in British Columbia is Major W. J. Collins, general mining manager and consulting engineer for the British America Corporation—$50,000 a year. W. A. Carlyle, who recently resigned the position of general superintendent and mining engineer for the British America Corporation, was paid $10,000 per annum, and resigned to accept a similar position with the Rio Tinto Copper Co, in Spain, where the salary is $25,000 per annum. W. H. Aldridge, manager of the Canadian Smelting Works at Trail, is paid $15,000 a year. James Breen, who built the smelters at Trail and at Northport, and who is the manager of the latter, receives a salary of $15,000 per annum and one-fourth of the profits. H. C. Bellinger, at the Northport smelter, receives $10,000 per year. Major Leckie, manager of the Republic mine at Republic, and consulting engineer B. C. mine, Boundary, receives $7500 per annum. W. B. Wilson, superintendent Le Roi, receives $5000 a year. Frank Robbins, general manager Mann & McKenzie's mining properties in Canada, is paid $7500 a year. Carl Hand, in charge Payne mine, Slocan, is paid an annual salary of $7500. George Hughes, in charge Idaho mine, Slocan, is paid $10,000 per annum. W. Y. Williams, general manager for the syndicate owning Mascot and California, Rossland, Knob Hill and Old Ironsides, Boundary, receives $5000 a year. Paul Johnson of the Boundary Copper Co., who has charge of the Mother Lode and the erection of a smelter at Greenwood, receives $7500 per annum. J. B. Hastings and E. P. Kirby each receive $10,000 per annum.

Coal Washing in the State of Washington.

The accompanying illustration is a view taken in the coal washery of the Carbonado Coal Company, at Carbonado, Wash. This plant is equipped with two Jeffrey coal washing tubs, each having a capacity, under ordinary conditions, of 400 tons each in ten hours. The coal is brought to the washer by a system of conveyors located immediately over the washers. From this conveyor system the coal is fed into the washer by means of chutes. This washer is of the Howe type; it is made of heavy boiler plate, cone shaped; at the lower end is a slate chamber with two valves; immediately above the slate chamber there are four inlets, through which the water is forced into the washing tub. In the center of this washer is a heavy shaft upon which stirring blades or paddles are fastened. These rotate, keeping the coal in a continuous state of agitation. In operation, the coal is fed into the washing tub at the center. As this material settles in the tub it is met by the upper current of water. This then carries the coal or lighter products to the overflow at the top, while the refuse or heavier material sinks below, being withdrawn from time to time through the slate chambers.

COAL WASHING MACHINE AT CARBONADO, WASHINGTON.

In operating the slate chambers the upper valve is open and the lower closed; and in discharging the upper is closed while the lower valve is open. The water is supplied through pumps. By the use of this system the coal is freed from impurities, thus enhancing its value. The simplicity of this washer is manifest, there being nothing to get out of order, a great point in its favor, especially when located in isolated places. The manufacturers say that the cost of washing by this method is as low as three cents per ton, including cost of maintenance and operating. The manufacturers of this washer, the Jeffrey Manufacturing Company of Columbus, Ohio, will be pleased to give further information to interested parties.

GENERAL LAND COMMISSIONER HERMANN has decided that title to none of the oil lands of Kern, Kings, Tulare and Fresno counties, Cal., is to be given by the Government without a full investigation as to the character of such land.

The Discovery of Gold-Bearing Conglomerate in British Columbia.

Written for the MINING AND SCIENTIFIC PRESS by K. LUDLOFF.

During the progress of recent geological investigation made in the Fraser River district I have discovered what I believe to be the principal source of gold of the Fraser river placers, which has heretofore been a matter of doubt. The locality is that part of the Fraser river between Quesnelle and Fort George, about seventy miles south of the last-mentioned place, above a group of islands called the Woodpecker or Red Rock islands, the Indian name for which is Tselken-nuh.

The formation consists of the crystalline slates of the Archæan, which form the country rock and the bed of the river. These slates are overlaid in certain limited areas by the uppermost strata of the Tertiary, but the whole surface almost everywhere in this part of the province is covered by immense masses of glacial drift consisting of boulders, gravel and sand. In the formation where the gold has been found in place, true veins between regular walls and irregular silicious dykes, both of greatly varying width, intersect and interlaminate, like a network, extensive masses of conglomerate of different structure but similar composition. They are accompanied by chloritic and hydromica schists, the whole irregularly imbedded in the clay slates by the Archæan, forming a belt about one and a half miles in width.

The gold occurs in the form of a fine dust almost everywhere in these rocks, but predominantly in the bright yellow, red, orange or brown-colored parts of the rocks, superficially decomposed and in their cleavages. The decomposition extends down many feet under the surface; boulders readily crumble to pieces under the blows of a prospecting hammer. Hundreds of thousands of tons of this decomposed ore lie on the surface. In this locality these rocks appear on the surface at many places, forming cliffs, steep walls, round knobs, or hogsbacks on the river banks and attract the eye of the traveler by their color and grotesque shape; they extend on both sides of the river into the unknown wilderness, how far is unknown as yet.

The deeper strata of this formation are rich in fine-grained iron pyrites and traces of gold. There are only faint indications of the presence of other metallic compositions.

The gold is easily detected by using a powerful lens at bright daylight. It can not be seen by the naked eye or a poor magnifying glass. The surface of certain parts of these rocks, also their interior, is speckled with gold grains. Their shape is mostly globular, only exceptionally flat or flaky pieces are seen. Their distribution is irregular.

It is well known that the gravel beds of the Fraser river are rich in placer gold, renewing themselves every year by inundations, and gold washing is carried on annually along the river by numerous Chinese, using the rocker.

Placer mining will undoubtedly pay at many localities here by hydraulicking out the irregularities of the surface of the bedrock underlying the gravel beds. The broken strata of the slates standing out from the surface, slanting or perpendicular, form holes and caves in which the gold is caught. Some of the creeks emptying into the Fraser river will furnish a limited amount and sufficient pressure of water by their natural fall to be used for the above-mentioned purpose.

Fine gold occurs abundantly, but coarse gold is rarely found. Rocker washing pays at the average about $3 a day. The working season is about five months of the year, the balance of the time being taken by overflows of the rivers, snow and frost. The gravel bar below the above-described discovery, and covering about sixty acres, contains much fine gold, seemingly originating principally from the conglomerates and brought there by a creek, crossing them in a deep gulch.

About twelve miles distant from the conglomerates, directly in the river bank, I have discovered a huge outcrop of red hematite and micaceous iron.

The nearest railway station is Ashcroft, on the Canadian Pacific Railroad. A wagon road built and sustained by the provincial government leads to Quesnelle. There is regular stage service between Ashcroft and the northern placers. The Fraser river is navigable between Soda creek and Fort George and farther, but it needs improvement. A horse trail leads from Quesnelle to the eastern shore of the river opposite Woodpecker island; distance about fifty-five miles. Traveling on the river is carried on in canoes and boats up to nine tons capacity. A canyon eighteen miles north of Quesnelle forms an obstacle against navigation by steamers.

The Indians at Fort George and the Chinese along the river furnish a limited number of workers at $1.50 to $2 a day and board.

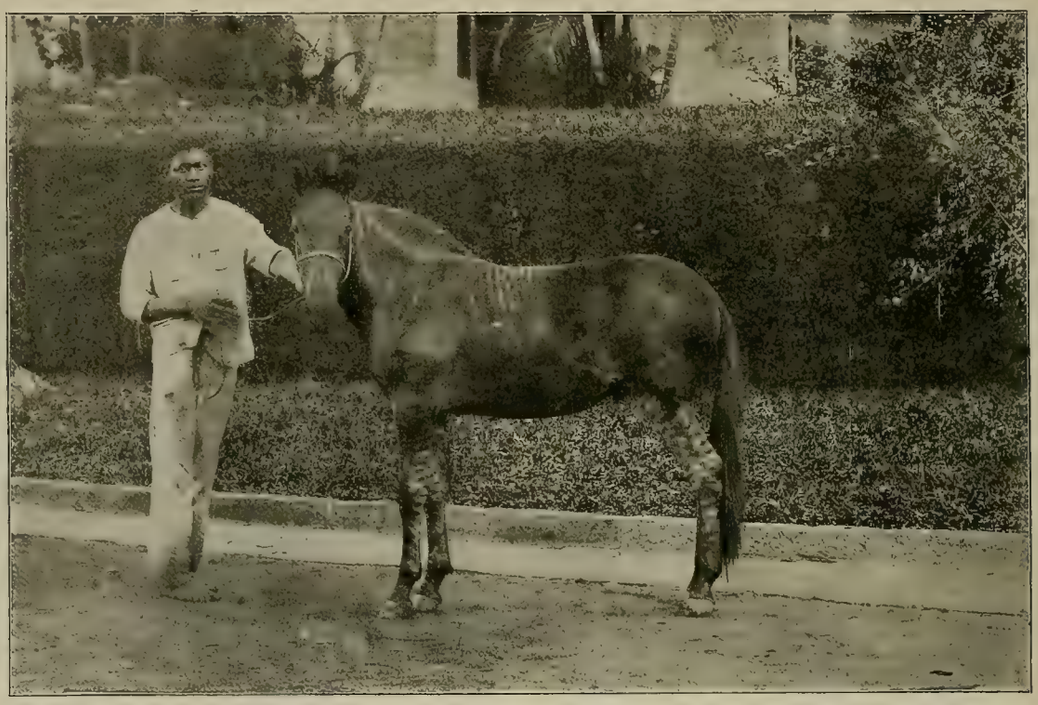
The climate is comparable to that of eastern Ontario or southern Wisconsin. The winters are about six weeks shorter than there.

This part of the province is entirely unsettled, although it contains large tracts of good farming land.

The country is abundantly timbered by Douglas firs, spruce, balsam firs, bull pines, red cedars, cottonwood, etc.

Quesnelle has about 1500 inhabitants, a telegraph and postoffice, a post of the Hudson Bay Co., stores, hotels, schools, churches, etc.

A number of claims have been taken up on the conglomerates and recorded, and many more may be taken up next spring.



Quesnelle P. O., B. C., Nov. 18th, '99.

The 20th Century Mule.

In this age of progress it may interest the mining and scientific world to note that it is proposed to improve upon an humble ally of many a miner, and furnish an improved mule. The mule of the 20th century is to be styled a "zebroid," which is the name given the new animal depicted on this page, representing a one-year-old "zebroid," who, like his brother mule, appears to have no pride of ancestry and no hope of posterity. He is the result of crossing an ordinary mare with a zebra. The year-old zebroid illustrated herewith is the property of Baron de Parana of Brazil, S. A.

The Baron says that they are very sprightly, but are at the same time gentle and become very docile with kind handling. They feed as well from the manger as on the pasture and are possessed of great muscular strength. Their size, slenderness, pace and disposition depend upon the dam, and they may therefore be bred for heavy or light draft. Crossing upon draft mares gives zebroids large and strong, but not so thick set as their dams. Crossing with lighter horses gives tall and slender zebroids, which Baron de Parana claims are fully as strong as the horse, but more tractable and suitable for work which requires quickness rather than strength alone. The Baron is convinced that the zebroid will prove of great economic importance, and he believes that the zebroid will displace the mule—in fact, will be the mule of the twentieth century.

Many have been the services of the mule to mankind. In war and peace the mule is the motive power of important enterprises. He does not figure largely in parade and display; but when it comes to steady going, persistent and intelligent effort and unyielding endurance, the mule has stood for generations without a rival. It seems unjust that a servant of mankind having undergone such labors and achieved such successes should have to brook a rival at this late day; but why indeed should the mule escape the hardships which the demon of change inflicts even upon mankind? Doubtless the mule will not murmur, although he is a kicker.

ONE YEAR OLD ZEBROID LORDELLO, OUT OF THE MARE STAEL BY THE ZEBRA CANON.

Zinc Roofing Plates.

A company has been organized at St. Louis to manufacture zinc roofing plates. Plates of zinc have been used for roofing in Europe, and are said to be indestructible. The plates withstand the air along the coast as the moisture contains more or less chlorine from the sea. No effort has ever been made to utilize zinc plates in this country for roofing, tin and slate being the products used to a greater extent, with here and there a few tile. The price of zinc plates as compared to tin plate is said to be favorable to the zinc on account of its lasting qualities, and because it does not need to be painted. The present output of zinc at Joplin, Mo., has had much to do with the venture, and the plant is to be erected in the vicinity of a zinc mine.—American Manufacturer.

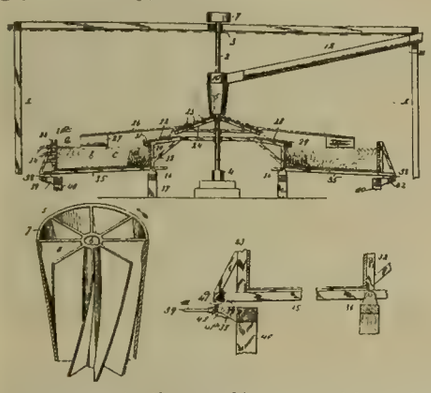
New Method of Slimes Treatment.

A new method of treating slimes in Australia is thus described in the North Queensland *Register:*

The slimes are trucked to the works, and there the required quantity of quicklime to neutralize the acid contained in them is added as the trucks are emptied into a hopper discharging into a disintegrator. The lime required per ton of dry slime varies from twenty to sixty pounds. After passing through the disintegrator, the powdered mass is raised by a bucket elevator to a top hopper, which discharges into side tip trucks running over the tops of the vats. Over each vat is a 6-inch centrifugal pump, the suction pipe of which descends at an angle to within 2 feet of the bottom of the vat, while the discharge pipe is continued down to the floor of the vat, where it is terminated by a right angle bend on a swivel point, so that the flow can be directed across to any part of the vat. The vat, being filled with solution of cyanide, the centrifugal pump is started, and in a few minutes the whole mass of liquor is in violent agitation. Into this agitated liquor the powdered slime is dropped, truck by truck, until the whole charge, amounting to ten tons, is delivered, the agitation being maintained the whole time. A few minutes after the last truck is dropped in the pump is stopped and the whole mass allowed to settle; this occupies some twenty minutes, the solution being left absolutely clear on top. A pipe, mounted with swivel joint, and connected with the pipe service leading to the zinc extractor boxes is then gradually lowered till the whole of the supernatant solution is drawn off. The vat is then filled with the weak solution, and the pump is once more set in motion; in a few minutes the whole mass is once more stirred up and the first process repeated. After the second solution has been drawn off clean water is added, and when the mass is worked into a slurry a plug in the bottom of the vat is opened and the thin slurry run off in wooden launders, whence it is raised and delivered away by a large centrifugal pump. Up to the present time 174 tons have been treated with the following results: Here is the result of the first extensive trial on Croydon Quartz Crushing Co.'s slimes: Average value before treatment: Gold, 9 dwts. 11 grains; silver, 2 ounces 17 dwts. 4 grains; gross value, £2 5s 10d. Average assay of residues: Gold, 2 dwts.; silver, 1 ounce 12 dwts., giving a value of 11s 8d. The bullion banked was 198 ounces 4 dwts. 12 grains, of a value of 16s 3½d per ounce. In addition to this, there is another 104 ounces 10 dwts. in the unsmelted precipitates, solution and zincs; this will come in next cleanup. The recovery is thus £1 8s per ton. As near as can be estimated, when working continuously, the total cost will not exceed 13s per ton, and may possibly be reduced below that figure. The necessary lime is procured in the shape of sea shell, and burned in a kiln at the works, the total cost of the pure lime amounts to £5 per ton.

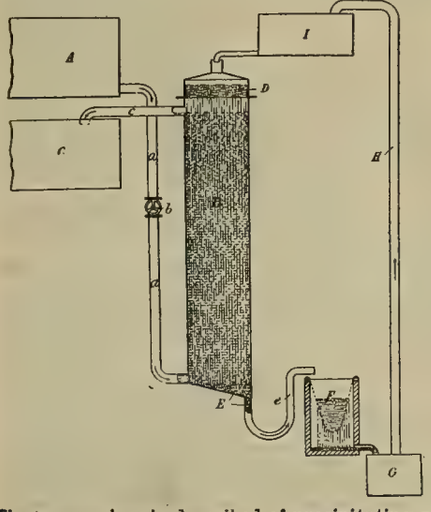
Latest Mining and Metallurgical Patents.

Patents Issued Dec. 5, 1899.



Specially Reported for the MINING AND SCIENTIFIC PRESS.

FEED CHUTE FOR SEPARATORS FOR ORE, COAL, ETC.—No. 638,062; F. Pardee, Hazleton, Pa.

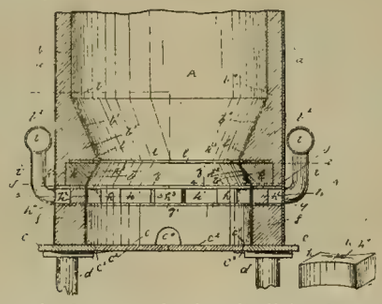


A feed chute for spiral separators, comprising two inclined main chutes and a bridge plate connecting the inner ends of chutes and formed with a laterally extending incline, and a lower chute arranged under the main chutes on a plane parallel therewith, and formed with a laterally projecting wing to receive and direct the material discharge from the lateral incline of the bridge-plate into the lower chute, and a third chute under the second chute formed with a laterally extending wing arranged to receive and direct material discharged from the other lateral incline of the bridge plate into the lower chute.

ORE CONCENTRATING MACHINE.—No. 638,276; T. S. Ridge, Kansas City, Mo.

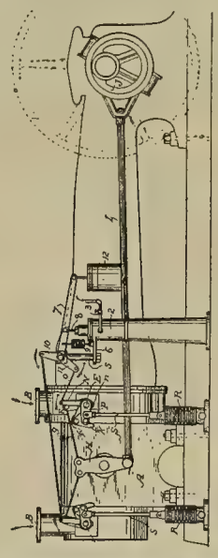
An ore concentrating machine, comprising a shaft, a motor or wheel mounted thereon, embracing a rim or casing and spiral spokes or flukes extending inward of rim or casing, a stationary hood surmounting wheel and provided with an opening to receive the ore-laden water, a vat, an annular table arranged above the inner edge of the vat, a check rail surrounding and projecting slightly above the outer edge of table and a slight distance therefrom, and a conical distributing disk amalgamator mounted upon the shaft below motor or wheel. An inclined valve-controlled flume communicating with the upper end of motor or wheel, a circular vat provided with faucets or cocks at different altitudes, a distributing disk amalgamator *24*, secured to shaft below the motor or wheel, a circular table projecting inward from the inner wall of the vat and having its inner edge overlapped by disk amalgamator, brackets secured to the vat, a check rail *29* carried by brackets, and sweeps *27* operating in the vat and secured to the distributing disk amalgamator.

PRECIPITATION OF PRECIOUS METALS FROM THEIR CYANIDE SOLUTIONS.—No. 638,372; M. B. Zerener, London, England.



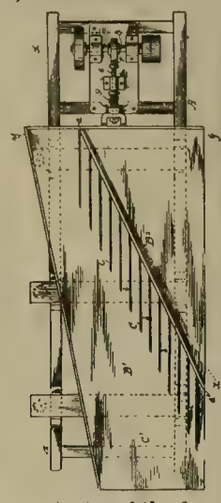
The process herein described of precipitating gold and silver from cyanide solutions, consisting in causing the solution to move in one direction and during such movement passing through it, in the opposite direction and in the form of a spray or a number of fine streams or films, mercury charged with alkali metal.

MINING APPARATUS.—No. 638,285; P. Schnetter, San Francisco, Cal.



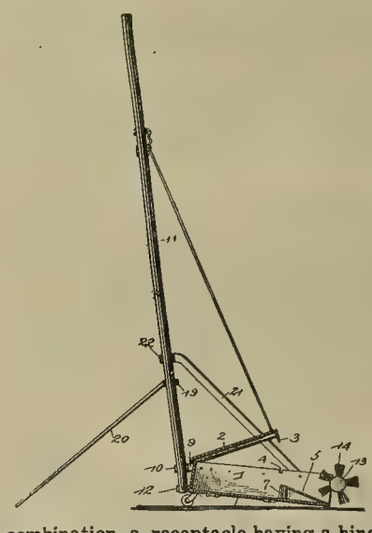
In mining apparatus for frozen ground, a stationary combustion chamber wholly open at bottom adapted to rest directly upon the frozen earth, a removable grate therein having upturned extension *35* at the rear, a removable bridgewall at the rear of grate, a downtake flue behind bridgewall, extending to the ground on which the combustion chamber rests, and a removable ashpit bottom *14* beneath grate, at such distance from the bottom of the chamber as to form a passageway for products of combustion along the surface of the ground, connected with downtake flue combustion chamber of rectangular form, provided with grates *10*, bridgewall *13*, downtake flue for surface working, a series of open-bottomed sections *2*, *3* and *4* hinged and forming an articulated flue to fit over the surface of the ground, means to hold the sections rigidly when adjusted, and links or eyebolts on the combustion chamber and on the sections composing the open bottom flue, so the whole apparatus can be slung and adjusted by lifting tackle.

CUPOLA FURNACE.—No. 638,541; M. Zippler, Allegheny, Pa.



A cupola furnance having its lining formed with an inclined firebrick or clay portion extending downwardly toward the interior of furnace at the base thereof, a metal ring under inclined portion, series of metal bricks forming an outwardly flared lining under metal ring under metal bricks, a series of metal blocks forming air spaces between them, and a metal ring between metal blocks and the base lining.

AIR COMPRESSOR.—No. 638,460; J. H. Hopps, San Francisco, Cal.



In an air compressor, a fixed arm the spindle of the inlet valve; a gripping device mounted loosely on the spindle and adapted to grip the outer end of the fixed arm; means for operating the gripping device from the motor or engine to move the inlet valve; a tripping device mounted loosely on the spindle and operated by the air pressure in the receiver or reservoir to disengage the gripping device from the fixed arm of the spindle when the supply of air to the receiver exceeds its exhaust; and a weight or spring connected with the fixed arm by which the valve is thrown wide open when the lever arm is disengaged from the gripping device. Means for automatically disconnecting the spindle of the inlet valve from the mechanism and power that drives it when the air supplied to the receiver exceeds its exhaust; means for throwing the inlet valve wide open when its spindle is disconnected from the driving power, and an automatic gripping device that couples and connects the valve spindle with the power driving mechanism when the air supplied to the receiver is below the draft upon it.

CONCENTRATING TABLE.—No. 638,324; W. G. DODD, San Francisco, Cal.

In an ore concentrator of the described class, the combination with the concentrating table, of an overflow riffle or rib arranged diagonally across the working face thereof, and of a series of parallel riffles or ribs joined to diagonal riffle rib extending longitudinally toward the foot or tail of the table. In an ore concentrator of the described character, the combination with the concentrating table, of an overflow riffle or rib arranged diagonally across the working face of the table and extending from its upper end to its lower side portion, riffle or rib decreasing in height from its upper to its lower end, and of series of parallel riffles or ribs extending from the diagonal riffle or rib longitudinally of the table or toward the tail or foot of the table, ribs or riffles being of a height corresponding with the height of the diagonal riffle or rib at the junction of ribs therewith.

MINING SHOVEL.—No. 638,681; F. D. Koch, Conchohocken, Pa.

In combination a receptacle having a hinged top and bottom, a metallic strip arranged on the sides of the receptacle, a loop formed from a strip in the rear, bearings formed on the extremities of the strip, a shaft, arranged transversely at the mouth of the receptacle, a brush on the shaft, means for driving the shaft, a handle and a connection from the hinged top to the handle. In combination with a receptacle adapted to be submerged, a hinged top having a depending flange on its front end, adapted to seat in recesses in the sides, a flexible connection for raising the cover, a scoop at the front of the receptacle having a rear inclined wall, an amalgamating plate in the rear of the scoop, a strip surrounding the receptacle on three sides, loops connected with the receptacle, a handle held by the loops, a brace rod pivoted to the collar on the handle, a sprocket wheel secured on the handle, a shaft arranged transversely of the scoop, a sprocket wheel thereon, a flexible band having recesses to receive the sprocket teeth.

Mining Summary.

ALASKA.

An important question has been decided by Commissioner Hermann of the General Land Office. The Commissioner decides that tide lands in the district of Alaska are not public lands, subject to disposal to individuals, under any of the existing land laws of the United States, and that the department has no statutory authority to make concessions to individuals of any mining rights pertaining to such tide lands. A citation is made by the Commissioner to the case of Stively vs. Boalby, decided by the United States Supreme Court, in which it was held that the United States, upon acquiring a territory, whether by cession from one of the States or by treaty with a foreign country, or by discovery and settlement, takes the title and the dominion of lands below high-water mark of tide waters for the benefit of the whole people and in trust for the future States to be created out of the territory, and it was further held that Congress had not undertaken by general laws to dispose of lands below high-water mark of tide waters in a territory, but, unless in case of some international duty or public exigency, has left the administration and disposition of the sovereign rights in such waters and lands to the control of the States, respectively, when admitted into the Union.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The altitude of Wilcox is about 5000 feet, and it lies in the heart of an immense valley, fringed by mountain ranges in the distance. It contains several large stores, and is the depot for supplies for a number of outlying mining districts, distant from fifteen to fifty miles. Among them are Dos Cabezos, Cottonwood, Dragoon, Pearce, Turquoise, Buckhorn, Chiricahua and Aravaipa, where Jno. W. Mackay's Grand Reef mine is situated. In all of these districts more or less work is going on, and a number of sales have been made to people with capital, who are doing systematic development work, and the outlook in most instances is promising. All these districts, as well as others of Arizona, have been retarded by men who have long held good mining claims, without doing more than assessment work, or, still worse, relocating from year to year and doing no work. An interesting feature in the Dragoon district came under my notice in connection with the discoveries of quartz carrying tungstic acid, used in hardening steel. In this particular instance the ore is known as hubnerite. It is situated in a canyon two to six miles wide and is found in placers which are worked dry and also with rockers, the output ranging from pebbles the size of a pea to large boulders. Geo. S. Mulkey, the owner of these placers, during a period of five months, with three Mexicans at $1.50 per day, took out over $5000. It is said that when Mr. Mackay begins to put out a large amount of mineral a railroad will be constructed to Aravaipa canyon.

Wilcox, Dec. 4th, '99.

MARICOPA COUNTY.

Copper ore is being shipped from the Cave Creek mines to the El Paso smelter.

MOJAVE COUNTY.

W. Weston and J. D. Murphy are arranging to sink a deep shaft on the White Hills mines, in the northern part of this county. The ores carry silver.

PIMA COUNTY.

The new Helvetia 175-ton smelter is in operation. Basing an estimate on 5% ore, it is said the smelter will net $1000 a day. The copper will contain about $35 in gold and silver. The metal will be refined electrolytically.

YAVAPAI COUNTY.

A diamond drill is in use on the Bosworth mines on the Agua Frio in prospecting, with good results.

A new shoot of ore has been found on the foot wall of the Lone Pine mine, 80 feet from the large sulphide bodies near the hanging wall. At a depth of 200 feet G. Rohpeter, the original owner of the mine and now superintendent, started a crosscut and 10 feet of concentrating ore has been cut. The mineral occurs in a white quartz and shows yellow sulphides with streaks of gray copper. It averages 6% copper and $12 in gold and silver. The Arizona Eastern & Montana Co. are preparing to increase their force on the property to 100 men.

CALIFORNIA.

Amador.

A wagon road is being built along the north bank of the Mokelumne river, two miles above Big Bar bridge, by the Stardard Electric Co., to a point four miles above the old location, near the Quartz Gem mines. A right of way across a piece of property was secured from W. T. Robinson, who owns the Electric mine. The cropping of the lode had to be cut into, and hundreds of tons of ore were uncovered. It is rich and the roadbed is a mass of quartz. Colonel Robinson will build a mill on his property. In the sixties a claim known as the State of Maine was worked near there, but the flood of 1861 washed the mill away and it was not rebuilt. The quartz at that time, it is said, milled $25 to the ton, but the sulphurets were not assayed.

Butte.

The Magalia mine has been dismantled and closed down, the workings of the mine having penetrated to such a great distance from the shaft as to render its further operations unprofitable under the numerous adverse conditions. A complete description of the mine appeared in the issue of April 8th, '99.

The Klora dredger is operated by electricity from the Yuba Power Co. Electric power costs $8 per H. P. per month.

Calaveras.

It was originally supposed that the large cash capital with which the Melones Co. began business would be sufficient to thoroughly equip the property. As an additional precaution, 32,423 shares of the original 200,000 shares capital stock were left in the treasury. The shortage of capital is due to two accidents which occurred when arranging for the mill. A ledge, supposed to reach across the creek, had been selected for the foundation of the dam. After the dam had been partly built, it was discovered that the ledge ran into quicksand, and during the delay a flood swept away that part of the dam already completed. The foundation for the 120-stamp mill was insecure and had to be reinforced and renewed at considerable cost. The necessary money is to be raised by sale of preferred stock, bonds and an assessment. It is reported that the mine is looking well.

The Calaveras G. M. Co. has filed articles of incorporation in the County Clerk's office at Salt Lake City, Utah. The capital stock is $100,000. O. P. Posey is Pres. The company owns a group of mining claims near Mokelumne Hill, which until recently was worked by Major Lucas.

Inyo.

Bishop *Register*: J. Enloe will run a 100-foot tunnel on his mine near Bishop. The hill in which the claim is situated is a mass of the chalky substance found in his workings, as he has found no walls in cutting across, and prospect shafts show the same material. Nearly all of it shows colors in horning.——T. W. Hill and J. H. Coe are working on the old Montezuma mine, southeast of Big Pine. They will run a 300-foot tunnel to tap the present workings. The deposit of ore is extensive. A switch has been put in at that point. The ore nets about $20 per ton, across a 7-foot ledge. Five carloads were shipped last week.——A. Cruse and L. B. Killion have five locations twenty miles northwest of Bishop, called the Granite Mountain group. The ledge on which they are working is 8 to 10 inches wide and its ore free milling. They have sent ten tons to Storey's mill to be worked.

Kern.

Representative Needham, on the 12th inst., went to the Interior Department to confer with the Commissioner of the Land Office to stop effectually the alleged frauds in securing title to oil lands in the San Joaquin valley. In addition to the order heretofore made withrawing from entry lands which have been described in letters and telegrams, Needham got the Department to issue another order requiring locators of these lands, who are attempting to get title with scrip, to publish a notice of their location in the nearest newspaper, and also requiring such locators to prove that the lands so taken are agricultural in their character and not mineral. The Department will hold that this order is retroactive. This order will place upon the scrip men the burden of proving that their lands are agricultural rather than mineral.

Lake.

The Abbott mine during November shipped 200 flasks quicksilver.

The La Joya mine, near Oakville, has resumed operations and will again be a shipper.

Mariposa.

The boilers for the Mariposa mine are to be set in a foundation of steatite (soapstone), which is abundant in this county. Men are sawing out blocks of the proper size from a deposit on Stockton creek, near Mariposa. The mine workings, which have been abandoned for years, are being unwatered and the shaft retimbered. This mine has opened a large quartz vein at or near a contact of black slate and diorite-porphyrite. A characteristic feature of the vein is the frequent occurrence of brilliant quartz crystals in rings in the vein. A large amount of gold was taken from the mine in its early history, much of it in masses or pockets. Besides the pockets a great deal of rock was milled, returning about $10 per ton, which at that time—about 1870—no more than paid expenses. Under modern condition a like return would net a large profit.

Mono.

Bridgeport *Chronicle-Union*: Arrangements are being made to run the mill at this mine during the winter months. The Low Land tunnel has been completed and has cut a fine body of quartz. A new tramway, 500 feet long, has been built from this tunnel to the mill; also new ore bins, carpenter and blacksmith shops, and new snowsheds have been erected. The sawmill has proved a success and decreased the cost of the tramway and buildings. The owner of the Castle Peak is A. D. Cullum of London, who is represented at the mine by E. J. Andrews, J. J. Kermeen being manager.——At the Alamo mine, in Little Antelope valley, work is progressing rapidly under the management of C. E. Watson, its new superintendent. Should the winter's work show a body of ore to warrant it, a mill will be erected in the spring.

Napa.

Quicksilver shipments for November were: Napa, 450 flasks; Ætna, 400; Great Western, 154; Vallejo, 118; Mirabel, 61; Sulphur Bank, 72. Total, 1255 flasks—a decrease of 148 flasks from the prev ous month's shipment. The month's shipment, at $50 per flask, is worth $62,750 to the producers. It is now higher.

Nevada.

A strike is reported in the Maryland mine, near Grass Valley. This mine is an extension of the Eureka-Idaho, and the new ore shoot is entirely independent of the rich Eureka-Idaho shoot, which produced many millions and is exhausted. Heretofore no great amount of exploration outside of the main shoot and vein referred to has been made.

A number of owners of city property in southeast Grass Valley have bonded the mining right attaching to their lots to E. M. Taylor and others, who now offer the consolidated right for sale at the rate of $2000 per acre.

A new air compressor is being put in at the Allison Ranch mine, on Wolf creek, below Grass Valley, and a large pump is to be placed on the 900 level. At one time the Allison Ranch was one of the richest mines in the State.

The shaft of the Brunswick mine, near Grass Valley, is to be straightened and the mine put in condition for more economical operation.

The South Idaho mine, near Grass Valley, is to be opened by J. P. Maleville. The machinery at the Daisy Hill will be moved to the South Idaho for this purpose.

Orange.

The tin discoveries reported from the Eastern side of the county, near the Riverside county line, are said to be genuine and to contain 14% tin oxide. It is reported that a site for smelters, etc., has been secured near Capistrano.

Placer.

W. Nicholls, Jr., owner of the Polar Star mine, will work four monitors during the winter run and thirty men will be employed. Two thousand inches of water will be used. The gravel is coarse and requires blasting. The Bear river dam, approved by the Debris Commission, will probably require no building up for the season.

San Benito.

The New Idria mines, sixty miles southeast of Tres Pinos, are producing 400 flasks of quicksilver monthly. A new plant has recently been put in at these mines and the low grade dumps can now be worked at a profit. These dumps are said to run from 1% to 15% metal. The hanging wall of these deposits is well defined and consists of finely laminated shales, in which there are occasional occurrences of quicksilver. The foot wall rock is arenaceous shale, graduating into soft sandstones.

San Diego.

The long tunnel run to cut the Kentuck S. vein, near Banner, has reached the lead and is reported in good rock. The success of this enterprise should give more confidence in the future of the district, as proving that veins are not of superficial character. The rich shoots of the district as determined on the surface have a vertical range of 1700 feet—from the bottom of the mines in the canyon near Banner to the summit of the hill above the Owens mine at Julian—and there is no reason to believe that the ore does not extend to that depth throughout the district, and the recent development in the Kentuck S. tends to substantiate this.

A company has been organized to reopen and operate the Helvetia mine near Julian, which has had many owners and managers, but of late years has not paid. All the workings are through a shaft, though it could be developed through a tunnel.

Santa Clara.

The Guadaloupe quicksilver mines, six miles east of Los Gatos, has been bonded by J. V. Coleman to Napa county, Cal., people, who say they intend to rehabilitate the mines. At one time, under the direction of Supt. Thayer, these mines produced 1200 to 1500 flasks of quicksilver monthly. The Guadaloupe mines are in the same belt with those at New Almaden, a few miles distant.

Shasta.

A strike is reported in the Midas mine, on Harrison gulch, in a new shaft, which unexpectedly cut a rich vein. Near the Midas Harwood & Huntington have found a rich vein on their claim, and the same vein has been discovered on the opposite side of Harrison gulch, on the claim of Fletcher & Sherk.

The engine house of the Summit mine, Sunny Hill district, was burned last week. Nitro powder had been placed over the boiler to thaw it. It caught fire, and the house and contents were destroyed.

L. F. Barlow has nearly completed his contract at the Summit mine, of driving an upraise 450 feet from the tunnel to connect with the shaft. The raise is from the tunnel, 1000 feet from its mouth.

Sierra.

A nugget of gold, valued at $600, was found recently by J. Gutgens near Logansville in the gravel.

The Diadem mine is being worked by J. M. Harper. Five tons of rock recently crushed at the El Dorado mill yielded $5000. A number of pockets have been found the past season.

The tailings of the North America mine are to be worked.

The upraise from the bedrock tunnel to the channel of the Swansea drift mine is thought to be approaching the gravel and is expected to reach it before Jan. 1st.

The Mammoth Spring mine, two miles east of Forest City, is being worked, and the workings are now in pay gravel. R. P. Mott is in charge.

Siskiyou.

(Special Correspondence).—Jillson & Co., who bonded the Fairy Queen mine some time ago, have struck a 15-inch vein of high-grade ore in the lower tunnel. They have also bonded the Central mine of C. R. Wiegel, in the same district. Two shifts are at work.

J. L. Coyle has completed a test run of 100 tons from the Tauina mine, an extension of the Hazel, near Henley.

H. Mattern of the Ashland mine has bonded four claims for $5000 on Rocky gulch and is developing the property.

Coles, Dec. 12th, '99.

E. Carlson is developing a mine on the head of Dutch creek. The ore contains copper and gold.

Spengler Bros. are working their placer ground at the mouth of Humbug creek.

The McCook mill, on Humbug, is running by water power.

A large number of claims have been located in East Fork district, and also in Gazelle and Butteville districts.

Etna *Advance*: The tailing dam at the Oro Fino gravel mine has been completed; it is one of the largest in northern California. Supt. Rusby is getting the pipes and elevators in shape to commence operations as soon as sufficient water comes to justify starting up.

Tuolumne.

The Bonanza mine at Sonora is again being unwatered. The inclined shaft is over 1400 feet deep.

At the Rawhide mine twenty stamps are dropping.

At the Jumper mine, near Stent, crosscutting is in progress on the 1100 level. Forty stamps are dropping.

A strike is reported in the Nonpareil mine, near Deer Flat. The mine is being opened by the Longfellow Co. of Big Oak Flat. It is reported that a steam hoist and a mill are to be built.

Yuba.

W. M. Jefferds of Brown's Valley is to sink a 5x12 vertical shaft on his Northern Light mine, situated at the edge of Brown's Valley. It is the intention to sink this shaft to a depth of 500 feet to tap the main Pennsylvania-Jefferson vein.

COLORADO.

BOULDER COUNTY.

The Big Five Co. have bought the Davidson mine at Ward for $8000. Previously it has been worked mostly by leasers.

CHAFFEE COUNTY.

The Buena Vista smelter has closed down, owing to a disagreement between owners and workmen over hours and pay. The report is that the management of the smelters posted a notice that twelve hours' work would constitute a shift beginning Dec. 11th, with no increase in wages, and the men walked out.

FREMONT COUNTY.

By the recent deal of the American Zinc-Lead Co., the capital has been increased to $1,000,000 and the principal office removed from Boston to Canyon City. Five new cupola furnaces and sixteen zinc furnaces are to be built, making a total of ten cupola furnaces and twenty-four zinc furnaces. It will have a capacity of 300 tons of zinc ore daily. The Canyon City smelter has in the past employed zinc ores chiefly in making zinc paint.

HINSDALE COUNTY.

S. D. Nicholson is trying to make arrangements to resume operations on the Ute and Ulay mines near Lake City, which were closed down on account of the coal famine a few weeks ago. The Ute and Ulay and the Golden Fleece are the largest mines in the county. The ores of the Ute and Ulay are chiefly lead carrying silver, and the mine outputs from 100 to 300 tons daily. During the summer, the mine and mill are run by water power.

LAKE COUNTY.

(Special Correspondence.)—The properties of the Penn M. & Leasing Co., on Breese hill, Leadville, are shipping seventy-five tons of ore per day, which consists of an oxidized, decomposed quartz, and comes from about 235 feet depth, though a prospecting shaft has been sunk to 700 feet depth. S. J. Sullivan is the manager.

The Adams, Maid and Wolftone improvements on the Wolftone grounds are progressing rapidly. Timbers are ready for the erection of the new gallows-frame over the 950-foot shaft. The frame will be 75 feet high and the shaft house 34x74 feet. This construction is in charge of John McLellan. The boilers for the new plant are being put in place. The hoisting machinery and pumps will arrive later. The shaft is to be sunk to 1250 feet depth.

The Greenback is located in the saddle between Carbonate and Iron hills. It is the property of Tingley S. Wood and Patrick Mulrooney, and is shipping 175 tons of ore per day, consisting of a clean iron pyrite, with considerable lead and no zinc. The first-class ore runs 50 to 60 ounces silver and .06 to .08 ounces gold, the second class running about 24 ounces silver, 35% excess of iron and about the same values in gold as that of the first grade. The first grade also carries a good excess of iron. A new shaft house has been completed. The depth of the shaft is 1100 feet, 4½x11 feet, giving room for water pipe compartment. From the shaft a drift runs southward 200 feet to the ore body, cutting the latter at right angles to the strike. The vein ranges from 14 to 40 feet in thickness. The surplus water, 500 gallons per minute, is handled by the pumps at the Mahala mine.

The Mike and Starr, located on the saddle between Iron and Breese hills, owned by the Hibendum M. Co., is being worked by three sets of lessees. The property produces low-grade iron pyrite, with sufficient copper values to make it specially desired by the pyritic smelters. The product of about 150 to 175 tons per day is being taken out through the Yak tunnel.

The New Northern, comprising a group of fourteen claims on Carbonate hill, has shipped as high as 100 tons per day of iron oxides, carrying silver values.

The new air compressor on the Ibex group has capacity for twenty-five air drills. It has two low-pressure air cylinders, 30x30 inches, which operate in tandem with two steam cylinders of same dimensions. The speed of the entire compressor is controlled by an air governor, which keeps the pressure uniform. The flywheel is 14 feet in diameter and weighs seven tons. In the same room is a boiler-compound tank, which holds enough of the material to last eight or nine boilers a month; this is fed into the suction pipe of the boiler feed pump, being arranged with sight feed so it can be fed into the boilers in the desired quantity. The hoists at the several shafts, the compressor and other machinery of the property are supplied with power from a battery of twelve boilers, aggregating 960

H. P. at No. 3 shaft, steam from which being conveyed as far as 1500 feet to various engines. An Edison direct multipolar, direct current dynamo, of 65 K. W. capacity, direct connected with engine, makes 280 revolutions per minute and lights the underground and surface premises of the Ibex and runs a diamond drill motor.

The Curren and Grand Prize, on Breese hill, are under a five-year lease to McAllister & Connell, who are working from a 500-foot shaft.

The Big Six is being developed further by an Aspen Leasing Company. The shaft is 400 feet deep.

The Denver & Rio Grande Railway Co. are extending their belt line around to the western and southern slope of Breese hill; and around the Ibex grounds they have erected very expensive snow sheds. WASCOTT.

Leadville, Dec. 8th, '99

(Special Correspondence).—The Iron Silver mine is producing nearly 300 tons per day, about 160 tons of which are iron sulphide ores carrying silver and lead, the balance being more zinciferous in character. The iron ores contain no oxides nor manganese. The ore body on this property is in a contact between porphyry and lime, the main working level being 400 feet depth. The work extends eastward from the shaft about 2000 feet. The crushing and concentrating mill is running eighty tons per day, having fourteen Wilfley tables, which are arranged in two rows, the one for the material crushed to 12 mesh and the other for that crushed to 25 or 30 mesh. The tailings from the coarse tables are also conveyed to the fine tables. The principal lead values are obtained in the coarse product, the iron with accompanying values in the fine product. The ores generally run 11% lead, 25% zinc, 18% to 22% iron. The concentrates from the mill average 27% lead, 22% iron. Those ores not milled are shipped.

Robert B. Estey and Norman M. Estey, as general manager and superintendent, respectively, are doing extensive development in various parts of the district for several different companies, in which Boston men are interested with them.

On the south slope of Breece hill the Comstock G. M. & L. Co. lease is being developed by sinking a shaft, now down 450 feet, over which is a good plant of machinery. Under the same management the Chippewa group on Breece hill is being developed as the Chippewa lease. One shaft has reached a depth of 600 feet and other shafts have been started.

On Rock hill two shafts are being sunk by the Revenue L. & M. Co. Buildings have been erected and machinery put in place for hoisting and pumping.

The Rialto group is also under the management of Messrs. Estey, and is located on the south slope of Iron hill. The Pyrenees shaft, one of the Rialto group, is 1250 feet deep, on which work is to be resumed.

Messrs. A. W. Lawrence, George H. Flint, George D. Edmonds and William G. Reed, all of Boston, Mass., are heavily interested with Messrs. Estey and Albert Hohenloe of Leadville in the various companies above named.

Leadville, Dec. 11th, '99. WASCOTT.

A strike of carbonate ore in the Nubian shaft on California gulch has been made at the depth of 450 feet. The ore carries 40 to 150 ounces silver per ton.

The gold mines of the sulphide belt back of Breece hill are outputting a large tonnage of pyritic ore. The principal shippers are the Ibex and New Monarch. It is expected the Resurrection will soon begin shipments.

A discovery of gold and auriferous pyrite is reported in quartzite in the Bently claim on Mount Zion, at Leadville. Up the Arkansas river gold is found in the quartzite at the same geological horizon and in South Dakota in a large number of valuable mines the gold occurs in Cambrian quartzite and there is no reason why it should not also be found in Leadville district, which is in the same geological horizon.

SAN JUAN COUNTY.

The new Sunnyside mill is to be run by water power, the pipe line being over a mile in length.

The Congress mine on Red mountain is producing a carload of high-grade ore daily. The working force is to be increased.

Ore from the Uncle Sam mine is being crushed in the Boston & Silverton Co.'s mill, where the ore is being delivered by pack train.

In the Henrietta mine a small vein of rich gray copper is being worked by the Paradox Copper & Gold M. Co.

SAN MIGUEL COUNTY.

Some time since the Liberty Bell put in an experimental cyanide plant for the purpose of testing tailings from their mill. Reported tests showed that considerable value escaping could be saved by cyanide treatment. In accordance with this result, operations at the mine have been materially curtailed pending the construction of a cyanide plant large enough to handle the mill tailings directly. Development work is in progress in the mine, but no stoping.

At the Palmyra group, in Turkey Creek basin, 500 feet of the old workings have been retimbered and the main tunnel is being driven on the vein. A new tunnel has been started, crosscutting to the vein, which it will reach 800 feet vertically below the surface. A mill will be built next year.

TELLER COUNTY.

(Special Correspondence).—There will be a big explosion at West Beaver Creek on the 18th inst. The Pike's Peak Power Co. on that date proposes to touch off about 30,000 pounds of explosives and throw down 40,000 cubic yards of granite, in their present work of building a steel-faced, granite-filled dam there. This will be one of the biggest things of the kind ever heard of.

Victor, Dec. 10th, '99.

A strike is reported in the Elkton Con. property on the sixth level, where it is said 12 inches of ore running over $3000 a ton has been found. Gold and tellurium are abundant. There is also over 5 feet of ore running several hundred dollars per ton.

The gold production of the Cripple Creek district for 1899 will closely approximate if not overreach $20,000,000. The monthly output for the first eleven months of the year has been as follows:

Months.	*Production.*
January	$1,550,000
February	1,296,750
March	1,504,000
April	1,513,000
May	1,576,212
June	1,300,000
July	1,181,980
August	1,445,300
September	1,731,000
October	2,003,600
November	2,515,500
Total	$17,607,342

The December production is estimated at $2,750,000, which, if realized, will make a total for the year exceeding $20,000,000.

IDAHO.

CUSTER COUNTY.

The Big Copper mine, near Houston, is reported to have a large amount of ore in sight. The workings are now down 700 feet and crosscuts are being run. W. Darlington, the Mgr., says if the ore carries sufficient pyrites he will build a pyritic smelter. The old smelter at Houston was blown in a short time ago and made a short run. It turned out $12,000 worth of copper, when the coke gave out. A new supply has been procured and the furnace will be blown in again. Next spring work will be prosecuted on a large scale and new furnaces will be built.

ELMORE COUNTY.

A strike of rich quartz at Spanishtown, a few miles from Rocky Bar, is reported, the ore of which is base at the surface. The ledge is owned by Towne & Kirby and is 5 feet in width. By roasting this ore, after pounding in a mortar, it pans out well.

IDAHO COUNTY.

Rich ore is being found in the Dewey on the Clearwater, four miles from Grangeville, some of it assaying $4000. The extent of the ore body has not been determined. S. I. Silverman is the manager.

It is reported that Clark & Sweeny have paid M. D. Pettibone $11,000 cash for the Vesuvius claim, at Buffalo Hump. The property has been prospected by crosscuts on the surface and sinking. The vein is 22 feet wide.

OWYHEE COUNTY.

For some months past a tunnel driving contest has been in progress between the De Lamar and Trade Dollar mines. Manager Huntley of the De Lamar says his men have made a record in tunnel work and have distanced the Trade Dollar crew so far that the latter gave up the contest some time ago.

MICHIGAN.

HOUGHTON COUNTY.

The Atlantic mine, during November, produced 300 tons of metal, which is the largest output in its history.

The Calumet & Hecla will build a new mill with six heads next spring, to stamp ore from the Osceola lode.

MONTANA.

The report of State Mine Inspector Byrne has been made public for the fiscal year 1898-'99. He says the mining industry in Montana gives employment to 12,316 miners. During the year there were but forty-nine fatal accidents, which is a decrease in percentage of the fatalities of the previous year. A comparison of the mining industry during the year with previous years exhibits a marked improvement. More mines are in operation; a greater number of men employed; better methods and results in the mining, smelting, milling, cyaniding, and the combination of those and other processes which are being applied to the recovery of values contained in the ores of this State. The results of the improvements in this direction are of incalculable benefit to the chief industry of our State, for not only is the productive area of the regular producing lodes increased in consequence, but several old mines, after a long period of inactivity, have again resumed operations and are yielding handsome profits from a class of ores that were worthless to their early operators.

SILVER BOW COUNTY.

The Speculator mine at Butte is making extensive improvements, says the Anaconda *Standard*. The old inclined shaft is down 900 feet, and through this the mine is being worked. The new shaft is 200 feet from the old one. The sinking of this shaft was begun last June and is progressing at the rate of 4 feet daily, three shifts of six men each being employed. It is down 650 feet, the timbering being carried along with the sinking. There are three compartments, each 4½ by 5 feet. The timbers are 12x12 with 12x14 center pieces. In sinking hand drilling has been exclusively employed, the purpose being to avoid the shattering of the walls of the shaft, which sometimes follows the use of machine drills. Over this shaft will be built a steel gallows-frame 52 feet high, and the hoisting will be done with double-deck cages. The foundation for the gallows-frame is built and the steel frame is on the ground. The hoist will be capable of working to a depth of 2000 feet. The engine was formerly in use at the High Ore. It will be housed in a steel building 40x45 feet. The foundations for the engine are being set. The boiler plant will consist of four 150 H. P. boilers, and they will all be connected with a steel smokestack 6 feet 9 inches in diameter and 125 feet above the foundation. Altogether the mine is employing 150 men. It is under the superintendency of W. W. Wishon, who also has charge of the Ramsdell-Parrot. The mine foreman is P. Sheehan. The work of ore extraction goes steadily on, although effort is now directed to the new work. The new shaft is to be sunk to a depth of 1000 feet. A connection has been made with the old one at the 400 level and another will be made at the 700. When the new shaft is down to the heavy ore bodies and the hoist installed the old shaft will be used for ventilation only. The Speculator is owned by the Largey estate and J. A. Creighton of Omaha, Neb. Lying on the border line between the silver and copper belts, its product is chiefly copper, but there is also a percentage of silver. The first-class ore is sent to Deadwood, where it is treated by the Golden Reward Co. The second class is worked mainly at the Colorado smelter. The mine is in the northeastern part of the district, near to the Bell and High Ore.

Butte hill is changing its appearance, the old-time wooden buildings which enclose wooden gallows frames and hoisting engines disappearing and in their places are going up steel structures. At several of the leading mines, including the Mountain Co. No. 2, High Ore and St. Lawrence, these are already in operation, while at the Mountain View, Speculator and others new ones are going up. The hoisting engines are enclosed in buildings of brick and steel. The new surface plants will have a capacity of working to 3000 feet. It has long been supposed that the copper zone was confined to the hill between Butte and Walkerville. The Cora mine, east of the latter place, has lately developed into a copper mine and leasers are working this mine through two shafts. F. A. Heinze is working the 600-foot level and taking out ore carrying forty ounces silver, $8 in gold and 3% copper. On the 300-foot level the percentage of copper is said to be higher.

The suit between E. R. Morse of Boston vs. Montana Ore Purchasing Co. (F. A. Heinze) has recommenced at Butte, to determine the ownership of the Michael Davitt, Rarus and Johnstown claims in the Butte Copper Belt. The case was recently tried and resulted in a disagreement.

NEVADA.

ELKO COUNTY.

It costs less than $3 per day to handle the water at the Young America with the new gasoline pump, says the Tuscarora *Times-Review*. Tests demonstrate that the pump can be run steadily for twenty-four hours on less than $8 worth of gasoline. Conservative estimates place the cost of fuel to do the same work at $20 per day.

ESMERALDA COUNTY.

Several miles southeast of Hawthorne, A. B. McCaw, of San Francisco, has interested Ballard and Martin, mining operators of San Francisco, Cal., in extensive copper deposits. These are now being developed with encouraging results. The zone in which these ores occur is 1000 feet wide and several thousand feet in length. Superficial workings at numerous places show the ore to occur scattered throughout the belt. The gangue is silica (jasper) and the ore red oxide (cuprite), in various stages of alteration, with malachite and chrysocolla. No sulphide ores have as yet been developed. If more extensive development justifies the building of a smelter it will be put up on Walker Lake. The grade of het ore thus far developed will average 8% or 9%, though a large quantity of ore going 20% can be readily sorted.

LINCOLN COUNTY.

A strike has been made at Stateline by D. Huntsman, who was an original discoverer in the La Sals. The best assays return $156 gold and 82 2 ounces silver per ton, of which there are 5 inches in a vein 18 inches wide.

STOREY COUNTY.

The 1950 level of the Con. Cal.-Virginia is being reopened, after having been abandoned several years. The workings are found somewhat caved, but are generally in better condition than was expected. The water is held 120 feet below this level by the hydraulic elevators.

NEW MEXICO.

GRANT COUNTY.

(Special Correspondence). — From Clifton and Morenci by way of the Arizona & New Mexico Railroad to Lordsburg, New Mexico, is seventy-one miles. Your correspondent visited the old camp of Shakespeare, situated seven miles from Lordsburg. In the month of April last there was one property being worked by California people, known as the Eighty-five. They were then opening a property carrying gold, copper and silver and netting about $40 per ton. Now the extension of this property, an old (supposed to be worked out) mine, is paying its owners $200 per day above expenses, and another old property, bought the past summer for $800, was paid for by sorting over an old dump. Shakespeare was in the early seventies a booming camp, and was one of the enterprises which W. C. Ralston of San Francisco had under way. It was at that time a silver mining camp and several mills and hoists in various stages of dilapidation still bear witness to the expenditures made. Near the mines an adobe town was built. The houses were closed for years and there were no signs of life there whatever last spring. Now there is an awakening. From the present outlook it would seem that there ought to be an opening for a concentrating plant.

Lordsburg, Dec. 3d, '99.

A new mining district has been discovered seven miles south of Georgetown, where ores of copper, lead and silver have been found. The ore is mostly low grade.

OREGON.

BAKER COUNTY.

A. J. Hendry, with S. S. Start and others, has secured a bond on the Wilson group, which adjoin the Red Boy on the south. There are five claims. The Wilsons have a tunnel in 100 feet, and the ores show a good prospect.

The Evening Star group, located near McCullock's Fork, three miles west of Sumpter, have been incorporated by the Evening Star M. Co.

A strike is reported in the Robert Emmet, at Cornucopia, an extension of the Red Jacket.

Several mines in Granite district are shipping concentrates to the smelters.

The Vananda group of mines on Olive creek has been sold to British Columbia capitalists, represented by Col. Topping. The price is reported to have been $1,500,000. The new company will erect a mill.

JOSEPHINE COUNTY.

The Josephine dredger at Sailor Diggings has started up again.

H. Rissue has made a strike on a claim in Bohemia district. The ledge is 8 feet wide. A deal was recently made of 640 acres of patented land, containing placer and quartz claims, on Galls creek, near Gold Hill. The buyer was F. H. Osgood of Seattle.

UTAH.

A bill has been introduced in the Senate to establish an assay office at Salt Lake City.

DOUGLAS COUNTY.

A copper strike is reported in the Copper Star mine, near Sedalia, where 2 feet of rich ore has been cut in an 8-foot vein. The mine is two miles from Sedalia.

JUAB COUNTY.

About 8000 shares of the outstanding stock of the Centennial-Eureka has been bought by Clark & Coolidge of Boston, for $500,000, completing the purchase of the 30,000 capitalized shares of the old company at a cost of about $2,100,000.

An important strike is reported on the 900 level of the Grand Central, at Tintic. The mine is making shipments of high-grade ore.

There is more activity in Dry canyon than in many years. The Mono and Hidden Treasure, which in the early days of the chloride excitement became noted, after years of idleness are again to ship ore from deeper levels than any reached heretofore.

SALT LAKE COUNTY.

The Bingham Tunnel Co. has decided to sink a shaft on the Keystone claim in alignment with the Bingham tunnel, and at the tunnel level start a heading each way to more rapidly complete the work. The shaft will be 385 feet deep at a distance of 5000 feet from the mouth of the tunnel. For this work an air compressor and an electric hoist have been ordered. The intention is to prospect the Keystone group, which is traversed by a well-defined vein.

J. T. Hudson, J. H. Stallings and R. Bemis have bought the Dewey mill at Bingham for $7500, and have bonded the Dixon group for $50,000. The mill is situated near the group, which comprises six claims. The ore contains gold, silver and lead, and runs from $10 to $40 per ton.

It is locally stated that a syndicate headed by R. C. Chambers, Mgr. Ontario mine at Park City, will build a smelter near Salt Lake, which will be a competitor with the American Smelting Co.

SUMMIT COUNTY.

The differences between the Daly-West M. Co. and the American Smelting & Refining Co. over the valuation of the former's Park City ore, says the Salt Lake *Tribune*, have been adjusted, and ores of the value of over $50,000 that have been tied up pending this adjustment will now be settled for.

The Ontario Co. has declared a $15,000 dividend. There are said to be $400,000 in the treasury.

In the East Ontario mine at Park City the vein on the lower level is 3 feet wide. The tunnel reaches the vein 1200 feet vertically from the surface.

TOOELE COUNTY.

Eight new steel tanks for the Mercur mill are each 30 feet in diameter by 5 feet high. They will increase the capacity of the plant 250 tons, making the total daily capacity 600 tons.

J. B. Weimer has bonded the Colossus, Success and three other silver and lead claims on Dutch mountain, in the Deep Creek district. Mr. Weimer says he believes he will be able to produce a tonnage of 300 tons daily in a short time.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence).—A crosscut run from the south drift of the Republic mine on the 600 level shows the vein to have a width of 53 feet of solid quartz. The raise connecting the 600-foot with the 400-foot level has been completed.

The Tom Thumb is troubled with water and it is proposed to put in a pumping plant and air compressor.

It has been decided to continue the shaft on the Rebate, adjoining the Tom Thumb on the south, an additional 100 feet.

Lighter parts of the Mountain Lion mill are arriving daily from Grand Forks. It will be impossible to haul heavier portions, now on cars at Grand Forks, until wagon roads improve.

The Gold Ledge on Gold hill has resumed work, after unwatering the shaft.

Whims for both the Delta and Hit or Miss have arrived, also lighter parts of Princess Maud compressor plant.

Excavation has commenced for the new 75-ton custom mill. Contracts call for completion not later than May 31st.

The Poland China group on Meyers creek has been bonded to a Montreal syndicate for $30,000.

The Park & Central tunnel in Davis Camp, on the south half of the reservation, has cut a 3-foot vein of galena assaying $50 in gold, silver and lead. It is thought the main lead is

some feet ahead. The tunnel has been driven 320 feet, and the depth attained on the vein is 200 feet. The property has a good surface showing of concentrating galena ore.

Republic, Dec. 5th, '99.

PIERCE COUNTY.

By an explosion of fire damp in the Carbonado coal mines on the 10th inst., thirty-two miners lost their lives. Seventy-six men were employed on the shift, the greater number of whom escaped or were rescued later.

WYOMING.

CARBON COUNTY.

The Kurtz-Chatterton copper mines, in the Grand Encampment district, is reported sold to a company of Chicago men for $50,000. Machinery will be put up at the mine.

FOREIGN.

AUSTRALIA.

The Broken Hill mine, New South Wales, is officially reported to have produced since its discovery 4,132,184 tons of ore, containing 397,969 tons of lead and 100,159,768 ounces of silver, the total value of which is about $100,000,000. The expense of production was about $55,000,000, and nearly $35,000,000 have been disbursed in dividends.

BRITISH COLUMBIA.

Gold Commissioner Graham of the Atlin mining district has made his annual report to the Provincial Government, showing that royalty has been paid for the season of '99 on 20,000 ounces of gold. Eight thousand placer and ten hydraulic leases and 650 quartz claims were recorded.

On the 12th inst. the roof of the No. 4 stope of the Union colliery caved, flooding the workings with fire damp, which exploded, killing several men. It came unexpectedly, as no gas of consequence had ever been previously noticed in this part of the mine.

The first shipment of ore from Greenwood camp over the new Boundary railroad has been made from the Snowshoe mine, and consisted of two cars of ore, hauled to Greenwood on wagons. This shipment went to the Trail smelter. The Snowshoe is under bond to the Rossland & Slocan Syndicate for $60,000.

A five-stamp mill on the Waterloo mine at Camp McKinney is paying all the expenses of development and ten stamps are expected to be added when the mine is satisfactorily developed.

The Ewing mine on Nigger mountain will build a four-mile road and ship ore during the winter months. The shaft is in 9 feet of shipping ore.

The quantity of ore shipped to the Trail smelter is about fifty tons a day.

The St. Eugene, Moyie, Queen of the Hills and Lake Shore groups in East Kootenay have been consolidated and will be known as the St. Eugene Consolidated Mining Co., with $3,500,000 capital. It is reported that 80,000 tons of ore are blocked out in the several mines.

About 300 men are employed in the construction of the Granby smelter, which is to be completed March 1, 1900, and will cost $300,000. A. W. B. Hodges is in charge of construction and will be the superintendent. J. P. Graves is general manager of the smelter company and also of the City of Paris, Majestic, Knob Hill, Old Ironsides and Victoria mines.

BRITISH GUIANA.

The principal gold output of British Guiana is from seven districts, as follows: Barama, Barima, Cuyuni, Demerara, Essequebo, Groete Creek, Mazaruni, Potaro, Puruni. The export of gold from these districts, from Jan. 1st to Nov. 7th, '99, was 92,841 ounces 4 dwts. 3 grains, valued at $1,645,915.93. In '98 it was 90,062 ounces 18 dwts. 16 grains, valued at $1,576,144.34.

CUBA.

There are three different companies operating Cuban iron mines, all of them with American capital. One of these is the Juragua Co., operating thirty miles east of Santiago, controlled by the Pennsylvania Steel Co. and the Bethlehem Steel Co. This company has shipped out 3,500,000 tons of ore to this country. East of that is the Spanish-American Co., controlled by the Rockefellers and operating at Daquiri. Seventy miles west is the new property of the Cuban Steel Ore Co. This company is building piers and opening up its mines so as to be ready to ship ore by May 1. The Cuban ores are all Bessemer ores of a high grade, running about 63% iron. The present production of Cuba is about 1,000,000 tons of ore a year.

SOUTH AFRICA.

The output of gold from the Rhodesia fields is reported for the years '98–'99 as follows:

	1898. Ounces.	1899. Ounces.
January		6,370
February		6,423
March		6,614
April	6,471	5,755
May		4,938
June		6,104
July		6,031
August	27	3,179
September	2,346	5,653
October	3,913	4,276
November	5,566	....
December	6,258	....
Total	24,581	55,343

No estimates have been made for the months of November and December, '99.

MEXICO.

The Guanajuato Con. M. & M. Co. of Guanajuato, Mexico, produced $23,600 in October. The November cleanup will not be reported until about the 10th of this month. The company contemplates increasing its capacity and has already ordered a portion of the new equipment.

The Discubriadora M. Co., thirty miles west of Mopimi in Durango, has ordered two 300-ton furnaces, which, when completed, will increase the daily capacity to over 1000 tons.

The New York & Sonora Smelting Co., J. B. Magruder, Mgr., is doing extensive development work at Las Cruces, about thirty-six miles east from Hermosillo, says *Modern Mexico*. It is working three mines: La Colorada, upon which it has sunk a double-compartment shaft to a depth of 300 feet; Los Muertos, upon which a tunnel has been run 500 feet, and Las Guias, upon which a shaft is now down 110 feet, and drifting both ways at the bottom. A new gasoline hoist was received at the camp last month.

Industrial Notes.

—Santa Fe railroad employes want more pay.

—Arizona justly asks for statehood at this session of Congress.

—A revolution in Peru has sent cocaine from $2.50 to $6.25 per ounce.

—The Pacific Mail Steamship Company will extend its line to Manila.

—The Nevada mineral exhibit for the Paris Exposition includes over 6000 specimens.

—At Dawson, on the 1st, oats were 20 cents a pound; meat 70 cents a pound wholesale.

—The Tesla, Cal., coal mine strike of employes on the wage question is being settled.

—The S. P. Co. will develop the coal beds seventy miles south of Ortiz, N. M., and ship to Guaymas.

—The Idaho Northern Ry., north from Nampa, Idaho, is graded seven miles; construction work is going on.

—Late Chinese papers say that there are at present six smokeless powder factories in operation in the Chinese empire.

—Oil is to be used on naval vessels, enabling Government transports to go from San Francisco to Manila without a stop.

—The total receipts at the Seattle, Wash., Government assay office since its establishment in July, 1898, to date are $18,374,396.29.

—The Rocky Mountain Bell Telephone Co. proposes to spend $500,000 in 1900 extending its lines in Montana, Wyoming, Utah and Idaho.

—The steamer Defiance, at Vancouver, B. C., from Vananda and other northern mining ports, brought smelter products valued at $25,000.

—A $25,000 refinery has been put in at the Sunset Oil Co.'s works at Sunset, Cal., where the entire output will be refined and distillate manufactured.

—A drydock to cost $750,000 is to be built at Hunter's Point, San Francisco. It will be over a natural rock basin, will be 750 feet long, 80 feet wide at the bottom and 120 feet at the top.

—The six Chinese Companies of San Francisco have donated $4000 to the California State Board of Trade to aid in bringing about closer relations between China and the United States.

—S. Pearson & Son, contractors for public works, have completed negotiations with the Mexican Government to take the Isthmus of Tehuantepec railroad on a fifty-year lease, to reconstruct a railroad and build a harbor at each end.

Personal.

R. J. COREY of Denver, Colo., has returned from a northwestern trip.

JAS. EARLE is now manager War Eagle Co.'s property, Silver City, Idaho.

BAER BROS. of Leadville, Colo., are interested in mining in Shasta county, Cal.

J. P. EVANS of the Colorado Iron Works has returned from Prescott, Arizona, to Denver, Colo.

JAS. MCFARLANE is now in charge of Homestake and Horseshoe Companies, Deer Lodge, Nevada.

JNO. BROCKMAN is the new manager Commonwealth, Arizona, M. & M. Co., succeeding N. S. Berray.

A. G. LAMSON, Mgr. Bingham Tunnel Co. at Bingham, Utah, has returned to the mine from Denver, Colo.

C. W. GUMP succeeds H. L. Swain in the superintendency of the Ibarra M. Co., Calmalli, Lower California.

LEO VON ROSENBERG of New York City is examining mines in New Mexico and will be in Los Angeles, Cal., on the 20th ult.

ADELBERT M. DEWEY, special agent U. S. Department of Labor, Washington, D. C., is in San Francisco securing statistics.

MAX BOEHMER of Leadville, Colo., visited Inyo county, Cal., last month to make examination of copper property near Keeler.

C. C. DERBY, long time Supt. New Almaden, Cal., quicksilver mine, assumes general management of the property on the 1st prox.

M. L. REQUA of San Francisco, Cal., has returned to Arizona to look after his recently acquired mining interests in that Territory.

BEN STANLEY REVETT of Breckenridge, Colo., is at Oroville, Cal., in connection with the Continental Dredging Co.'s operations on the Feather river.

WAKEFIELD BAKER, Pres. Pacific Coast Jobbers' and Manufacturers' Association, has returned to San Francisco from the Atlantic side of the continent.

JOHN DOESCHER of New York, Pres. of the Siskiyou Mining Co. of California, has been making a personal inspection of the company's holdings in Siskiyou county, Cal.

PROF. W. L. WATTS has returned to San Francisco from an investigation of oil lands in Monterey county, Cal. He has assumed his duties in the service of the State in a continuation of his labors in the petroleum fields and in the examination of mines.

JOHN H. LODER of the Loder Pyritic Reduction Co., Denver, Colo., goes to Atlanta, Ga., to supervise starting a Loder pyritic smelting plant about completed in that vicinity.

R. H. WARD, a California miner who is developing British Columbia hydraulic property, is in San Francisco from Quesnelle, Cariboo district, B. C. He will return early in 1900.

T. T. LANE of Angels, Cal., is in San Francisco, Cal., from his mines near Parral, State of Chihuahua, Mexico. He will give particular attention hereafter to the silver-lead mines of that region.

CLARENCE HERSEY recently made examination of a mining property in northern California. Mr. Hersey has continuously maintained an assay office in Leadville, Colo., for the last twenty-one years.

BERNARD MACDONALD has accepted the general superintendency of the British American Corporation, Rossland, B. C. For some years he has been in Canada in charge of the McQuaig-Rykert Syndicate of Montreal.

GOV. MURPHY of Arizona has appointed as delegates to the Mining Congress in Milwaukee in June, 1900, James Douglas, Pres. Copper Queen Co., S. A. Parnell of the Globe Co., and J. B. Seager of the Helvetia Co.

PROF. W. P. BLAKE, Territorial Geologist of Arizona, reports officially that thus far none of the samples of rock from the Arizona discovery submitted to him for determination as to platinum contents contain that metal.

B. K BANNISTER, Gen. Mgr. Utah Power Co., and consulting engineer for the Payette dam and electric power project, is at Boise, Idaho, and says that the enterprise noticed on page 640 of the issue of the 2nd inst. is meritorious and feasible, that the surveys will soon begin and involves the investment of about $750,000.

List of U. S. Patents for Pacific Coast Inventors

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 5, 1899.

638,208.—LOOSE LEAF LEDGER—J. W. Amrath, S. F.
638,375.—ROTARY ENGINE—C. F. Baintel, Los Angeles, Cal.
638,438.—FLY TRAP—J. L. Boone, S. F.
638,620.—MITER BOX—T. Bootsman, Arctic, Wash.
638,377.—CHEESE CUTTER—E. S. Burt, Glencoe, Cal.
638,321.—SUB-IRRIGATION—B. O. Clark, Pasadena, Cal.
638,324.—CONCENTRATING TABLE—W. G. Dodd, S. F.
638,384.—SELF-LOCKING BOLT—G. H. Dyer, S. F.
638,325.—FRUIT EVAPORATOR—D. M. Ellsworth, Camas, Wash.
638,386.—NAIL—C. S. Farrow, Eugene, Or.
638,390.—STORAGE BATTERY—Hanscom & Hough, S. F.
638,456.—PLOW—H. Hansen, Redwood City, Cal.
638,460.—AIR COMPRESSOR—J. H. Hopps, S. F.
638,393.—CABINET—H. E. Hutchinson, Mt. Vernon, Wash.
638,585.—FRUIT GRADER—J. Mann, Butte City, Cal.
638,468.—DENTAL PLIERS—H. L. McKellips, S. F.
638,644.—BALING PRESS—J. N. Neuman, Riverside, Cal.
638,283.—PRESERVING MILK—J. Russell, S. F.
638,285.—MINING APPARATUS—P. Schnetter, S. F.
638,404.—DOOR LOCK.—C. E. Smith, Oroville, Cal.
638,292.—FOOT GUARD FOR RAILROAD TRACKS—P. J Stockinger, Oakland, Cal.
638,406.—MILK COOLER AND AERATOR—A. L. Stone, S. F.
638,540.—HOSE SUPPORTER—Ella F. Young, S. F.
31,941.—DESIGN—H. Root, S. F.
31,935.—DESIGN—J. M. Smith, Villa Park, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Recently Declared Mining Dividends.

Osceola C. M. Co., Mich., $3; Dec. 15.
Orphan Bell M. Co., $82,899; Dec 7
Swansea G. M. Co, Utah, $10,000; Dec. 9.
Silver King M. Co., Utah, $50,000; Dec. 15.
Bullion-Beck M. Co., Utah, $10,000; Dec. 15.
Portland G. M. Co, Colo, $60,000; Dec. 15.
Elkton G. M. Co., Colo., 3%; payable Dec. 20.
Alliance M. Co, Colo, 7 cents per share; Dec. 4
Ontario S. M. Co, Utah, $15,000; payable Dec. 20.
Tamarack C. M. Co, Mich., $6; payable Dec. 28
Daly-West M. Co, Utah, 20 cents per share ($30,000); Dec. 10.
Calumet & Hecla C. M. Co., Mich., $20; payable Dec. 29. Total to date, $66,850,000.
Stratton's Independence Limited, Cripple Creek, Colo., $488,000; Dec. 12. Total, $976,000.
New York-Honduras Rosario M. Co., Honduras, $30,000; payable Dec 16. Total to date, $1,160,000.
Yellow Aster G. M. Co., California, $20,000; Dec. 11. Total, $313,789.

Commercial Paragraphs.

THERE has just been put upon the market by John Taylor & Co., 63 First street, San Francisco, a patented hydro-carbon burner wherein either coal oil or gasoline can be used as fuel. For many years gasoline has been employed in crucible and muffle work by assayers and others, but not until the present time has it been possible to use coal oil for this purpose. The burner herein noted is devised for coal oil. The advantage of this burner becomes apparent when the greater safety of coal oil is considered as compared with gasoline. Coal oil can be procured in all parts of the world. Gasoline is sometimes obtained only with difficulty. By a slight change of jets in the Taylor burner gasoline can be used in place of coal oil, and for those who have been accustomed to the use of this latter fluid may be preferable.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HINGED TELESCOPIC BOX.—C. J. Russell, Santa Maria, Cal. No. 637,997. Dated Nov. 28, 1899. This invention relates to a telescopic box having hinges and slidable guides so arranged that the two telescoping parts of the box may be adjusted to give any desired depth within its capacity. At the same time the parts are connected by the hinge so that they can be opened without separation when they are extended to their fullest capacity. The box consists of two sections of any suitable material, one of which is slidable within the other. Vertical bars are fixed upon the sides of one of the sections and corresponding clasps in which the bars are slidable are carried by the other section. Holes are made in the bars and spring latches fixed upon them, the other section have pins which are adapted to engage the holes in the bars and retain the parts at any adjustment with relation to each other. The clasps are hinged and are carried by the turnable leaf of the hinge in which the rear of the T-shaped bars are slidable so that the sections may be extended to their limit and then opened about their hinges and without separating the parts, as is usual with ordinary telescopic boxes.

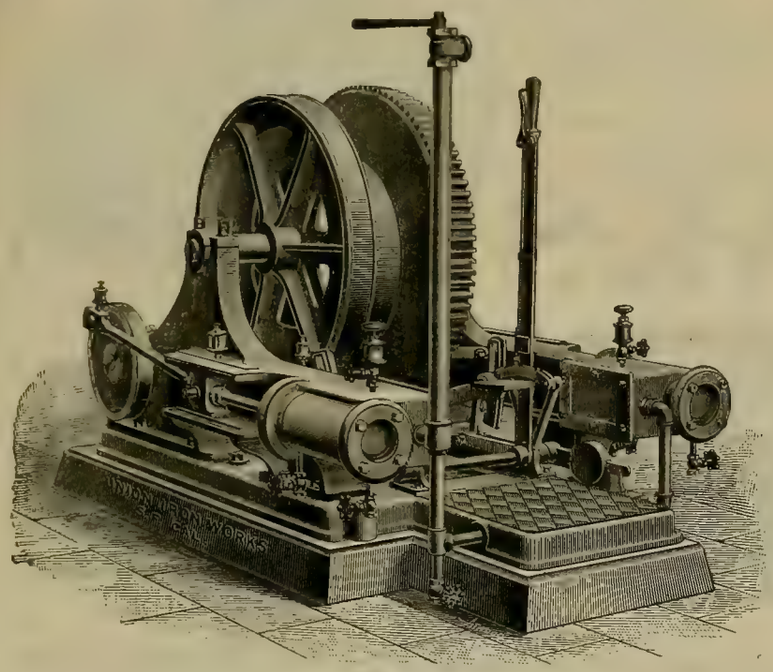
MILK COOLER AND AERATOR.—A. L. Stone, San Francisco, Cal. No. 638,406. Dated Dec. 5, 1899. The object of this invention is to provide an apparatus for cooling and aerating milk. It consists of an outer casting having a removable interior casting formed with side walls and inclined step-like surfaces, with a closed chamber beneath said surface. Outlets are formed between each pair of the surfaces so that a blast of air, delivered into the rear end of said chamber, is forced through the milk which flows over the steps.

CHEESE CUTTER.—E. S. Burt, Glencoe, Cal., assignor of two-thirds interest to J. Burt of same place, and W. E. Holbrook of West Point, Cal. No. 638,377. Dated Dec. 5, 1899. The object of this invention is to provide a device for cutting cheese into desired sizes for sale and use. It consists of a support for the cheese having a removable cap or cover, a vertically slotted guide exterior to the periphery of the support, a knife or cutter of substantially triangular shape, having the deepest portion adjacent to the guide, and having a longitudinal stem or shank movable in slots in the guide. The rear end of the shank has a guide, and the lever is fulcrumed to this rear guide and a rod connected with the knife passes through the slotted guide so that by the operation of the lever the cutter may be forced down vertically through the cheese. Anti-frictional rollers are journaled between the clamps and travel against the guide bar to reduce the friction of the movement. The edge of the knife is curved, the inner end forming a point which first enters the cheese near the center, and the edge is so contrived that it makes a drawing cut which facilitates the work. The edge of the knife which cuts the outer portion of the cheese is made convex, and this fits into a similarly shaped channel in the supporting base so as to insure the severing of the cloth with which the cheese is wrapped.

DOOR LOCK.—C. E. Smith, Oroville, Cal. No. 638,404. Dated Dec. 5, 1899. This invention relates to locks for doors. It consists of a latch bolt guided and slidable through the edge plate of the lock and lugs between which the inner end of this bolt is slidable and guided, a spring surrounds the inner portion and is compressed between the lugs when the latch is withdrawn, and acts to force it forward when released. There is a turnable socket piece through which the knob shank passes, and this socket piece has an extension or arm at one side, and a latching link detachably connecting the extension with the inner end of the latch bolt, so that the turning of the knob will withdraw the latch after the key has been inserted and turned.

SELF-LOCKING BOLT FOR BUILDINGS.—G. H. Dyer, San Francisco, Cal. No. 638,384. Dated Dec. 5, 1899. This device is intended to be used where it is necessary or desirable to insert bolts or bars into brick, stone or other masonry walls, and to secure the same therein to form a permanent support for structures, such as balconies, fire escapes and the like. It consists essentially of a bolt having a turnable key upon its inner end, a contact surface against which the key is supported, and means for turning it and causing it to lock when it has been inserted into place, a hole being bored or drilled in the masonry wall of sufficient size. A tube is inserted to the proper depth to allow the bolt to extend through the tube and beyond its inner end, when the beveled inner edge of the turnable key being interior to the inner end of the tube, will engage it, and when a nut is screwed upon the outer end of the bolt, so as to pull it outward, it forces the key to turn and enter the masonry surrounding the hole, thus standing transversely across it and being permanently locked in place.

Catalogues Received.



"SOME Recent Compressed Air Machinery" is the title of a treatise on various devices and apparatus with compressed air as motive power, issued by E. A. Rix, 507 Market St., San Francisco, California, reprinted from technical journals and replete with information thereon. The pamphlet is worth reading and will be sent to any one interested therein asking for it.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

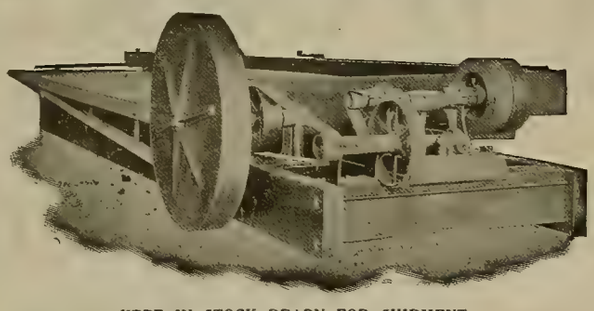
"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars, and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address



THE BEST MANUFACTURING CO.,

San Leandro, Cal., U. S. A.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

Over 2000 in Use.

KEPT IN STOCK READY FOR SHIPMENT.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

THE WILFLEY CONCENTRATORS HAVE LARGE CAPACITY, EASY ADJUSTMENT, ARE SIMPLE IN CONSTRUCTION, AND NOT LIABLE TO WEAR.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 300 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

THE COLORADO IRON WORKS CO.,

Established 1860. DENVER, COLO.

MANUFACTURERS OF

Smelting Furnaces and Equipments

For the Treatment of

GOLD, SILVER, LEAD, COPPER and PYRITIC ORES.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.

(SEE PAGE 700.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

We make all kinds of Cars, Skips and Charging Carts for the Mine Mill and Smelter.

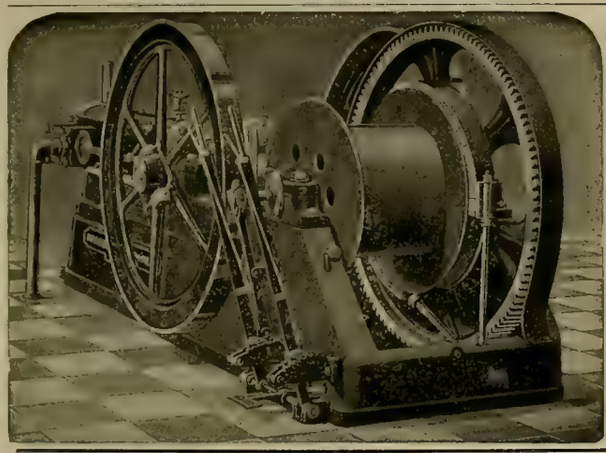
SEND FOR PAMPHLET.

Dealers Wanted in Mining Sections to Handle the Truax Ore Cars.

THE BRYAN ROLLER QUARTZ MILL.

We are the sole manufacturers of this Mill. A test made by the Bullion-Beck Co. of Eureka, Utah, with this and the Huntington Mill proved conclusively every claim we made for the Bryan Mill, viz: that the Bryan would crush more ore with less repairs, less power and less slimes than any Mill made. Result — they are now operating three of the five-foot Bryan Mills and find them superior and more satisfactory than any Mill they ever used. L. C. Trent & Co., who had formerly sold the Huntington Mill, immediately manufactured a Mill infringing our patent. Suit brought in the U. S. Court resulted in a verdict in our favor, and we shall prosecute to the full extent of the law any infringement of any character whatsoever in the MAKING, USING or SELLING of the same. : : : : : : : : : : : :

Strong.
Economical.
Simple.



MANUFACTURED BY

The BRYAN MILL is constructed on the principle of the Chili Mill, except it has three rollers arranged to run in a continuous discharging pan. It crushes either gold or silver ores. It consists of an annular cast-iron mortar with fixed steel dies arranged in the path of its three crushing rollers. Power is applied direct from a pulley through a bevel gear and pinion secured to stationary center post. We present a few of many advantages it possesses over any other Mill: Larger screen capacity and free discharge. Amalgamates a larger percentage of gold. Quickly and cheaply erected; with regular feed and proper flow of water requires little attention. Crushes hard or soft ore with smaller amount of power per ton and less wear and tear of machinery. : : : :

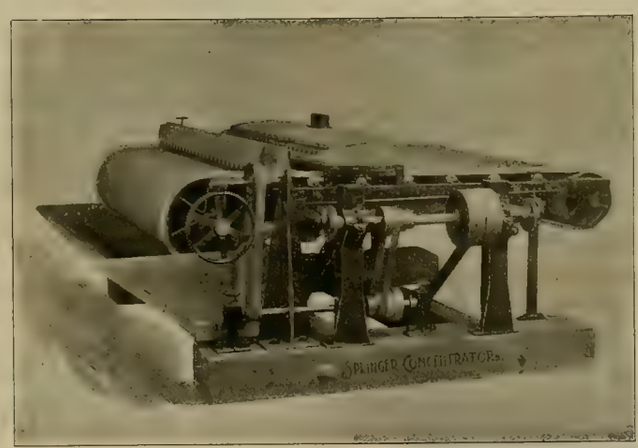
Skeleton Mining Report.



NEEDED BY EVERY MINING MAN.

FIFTY CENTS POSTPAID.

Mining and Scientific Press, 330 Market St., S. F.

$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.

PATENT SOLICITORS,
330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

DEWEY, STRONG & CO.,
PATENT AGENTS, 330 Market St., S. F., Cal.
Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

No. 045 Button Balance.
Sensibility 1-50 Milligramme.
This balance was designed with a view to furnishing an accurate and reliable balance for silver button and moderately accurate gold button work.
It has all the latest improvements and is an up-to-date balance in every particular.
If you anticipate buying and want a good balance at a moderate price, write us for particulars; you will be surprised to find how cheaply this balance can be purchased.
For complete description of this and other balances write for catalogue A to

THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

Market Reports.

SAN FRANCISCO, Dec. 14, 1899.

SILVER.—London, 27¼d; New York, 59@59¼; San Francisco, 59@59¼; Mexican Dollars, 47½@48¼; New York exchange, sight, 10; telegraphic, 15 cents premium.

LEAD.—New York reports steady, $4.60 bid, $4.75 asked; brokers' price, $4.45.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¼c; bar, 6½c.

COPPER.—New York reports Lake at $16.55@17; brokers' price, $17. Local—Mill copper plates, 23¾c.

Extensive shipments of copper from Lake Superior by rail have commenced. Last winter was the first time in ten years in which copper was shipped by rail from smelters at Houghton, Mich., it being the custom to hold copper during winter until reduced rates could be had on water transportation in the spring. Copper will be shipped as fast as smelted this winter, which proves the strong demand, as all rail shipments cost fourtenths of a cent per pound more than mixed water and rail route to seaboard, making added transportation cost about $275,000 for the five months navigation is closed.

IRON.—American, soft, $24@25.50 per ton; Scotch, $37.50 Local bar, 2¾c per lb.

It is reported that large shipments of iron ore are to be made from Cuba, and that the output of 1900 from that source will reach 1,000,000 tons.

STEEL.—11¼@20c per pound.

TIN.—Firmer, $25.25 bid and $25.50 asked; pig, 36@39c per lb.

ANTIMONY.—In San Francisco 1000 pounds and upwards, 10c net; 300 to 500 pounds, 11@14c; less than 100 pounds, 15c.

BABBITT METAL.—No. 3, 8¾c.

QUICKSILVER. — Local, $51.50@52; export, $46.50@47; carload lots, special rates.

Quicksilver shows still a slight upward tendency, and there is no indication that the price will go lower unless some great producer came unexpectedly to the front, which is improbable. The rising market is daily having a more noticeable effect. The Guadaloupe mines, near San Jose, Santa Clara county, Cal., are to resume after an idleness of years. This property at one time was a large producer.

ALUMINUM.—No. 1, 99% pure in ingots, for remelting, 37c per pound, in small lots; 35c per pound in 100-pound lots; 33c per pound in ton lots and over. No. 2 grade, 90% pure, cast in ingots for remelting, 34c per pound in small lots; 33c per pound in 100-pound lots; 31c per pound in ton lots and over. Aluminum castings, according to number, weight, moldings, etc., 45c per pound, upward. Aluminum sheet from 38c per pound upward. Lots of less than 50 pounds, 5c per pound higher. Nickel aluminum casting metal, 39c per pound in small quantities; 35c in 100-pound lots and 33c in ton lots.

ZINC.—Dull; $4.60 bid, $4.70 asked.

Prices for spelter are lower, but the general situation has shown improvement of late, and the expectation is that the lowest prices have been reached. There is still a large profit to the producer with zinc above $30 per ton, and Joplin advices are that it is unlikely to decline below the $30 mark. The decline in the metal has placed the industry on a healthier basis.

ASSAY LITHARGE.—100 lbs., 12c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c, No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $5.10 per 1000 feet; double tape, $4.35; single tape, $3.45; Hemp, $3; Cement No. 2, $4.35; Cement No. 1, $3.45.

NAILS.—List per keg: No. 20 to 60d, wire, $4.45; cut, $4.15; 10 to 16d, wire, $4.50; cut, $4.20; 8d, wire, $4.55; cut, $4.25; 6 and 7d, wire, $4.65; cut, $4.35; 4 and 5d, wire, $4.75; cut, $4.45; 3d, wire, $4.90; cut, $4.60; 2d, wire, $5.15; cut, $4.85. In carload lots, special rates in carload lots 10c per keg less.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32@33c ₱ lb.; carloads, 29@30c; in 10-lb. tins 37c; sulphuric acid, 1½c per lb. 66% B.; soda ash, $1.60 per 100 lbs. 58%; hyposulphite of soda, 2½@2¾c per lb.; blue vitriol, 5¼@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¼@1¾c; nitric acid, in carboys 8c per lb; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., 65c; sks., 60c ₱ 100 lbs; chloride of lime, spot, 2.10@2.25c; nitrate of potash, in kegs, 8c; chlorate of potash, 25c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco coast, yard prices:

Wellington	$8 00	Coos Bay	$5 00
Seattle	6 00	Southfield	7 50

Cargo lots, Eastern and foreign:

Wallsend	$ 7 50	Cumberland	$ 9 50
Brymbo	7 50	Cannel	9 50
Pennsylvania, hd..	14 50	Welsh Anthracite	12 50
Scotch	8 00	Rock Springs	7 60

COKE. — Foreign, $13; domestic, $12 per ton.

OILS.—California Castor, pure, cs., $1.15 per gal.; bbl., $1.10; pure No. 2, cs., 90c; bbl., 85c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, $1.24; less than 200 gals., $1.28; in bbls., 4c per gal. less than case; Baker's Crystal, $1.45; China Nut, 55c; Linseed, strictly pure, boiled, bbl., 66c; cs., 71c; raw, bbl., 64c; cs., 69c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 61c; cs., 66c; raw, bbl., 59c; cs., 64c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 20c; Astral, 20c; Star, 20c; Eocene, 22c; Extra Star, 24c; Elaine, 25c; Water White, bulk, in tanks, 14c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86 deg. Gasoline, bulk, 21c; do., cs., 27c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 59c; cs., 64c; No. 1 bbl., 49c; cs., 54c; Neatsfoot Oil, bbl., 55c; cs., 65c; No. 1 bbl., 50c; cs., 52½c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, $1.25@1.35 per gal.; wagon colors, $2@2.25.

Assessment Notices.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of November, 1899, an assessment (No. 10) of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 632 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of January, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—632 Sacramento street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of November, 1899, an assessment (No. 14) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 30th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of November, 1899, an assessment (No. 21) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2nd day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of November, 1899, an assessment (No. 3) of ten cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 20th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

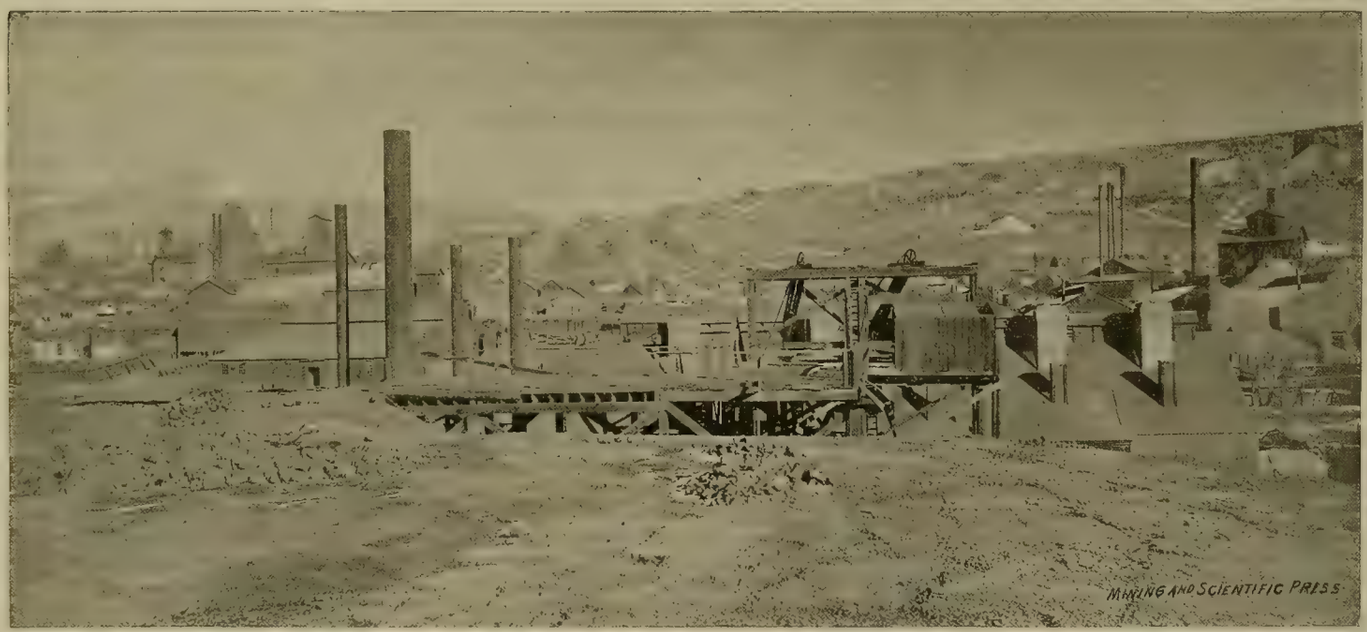
Hill Sculpture Due to Erosion.

That particular part of the California gold belt known as the mother lode is characterized throughout its length, and particularly in Mariposa, Tuolumne and Calaveras counties, by a succession of hills which rise abruptly above the surrounding lower rounded slopes. A number of these elevations form prominent features in the landscape, among them being Mount Ophir, Pinon Blanco and McAlpine hill in Mariposa county; Quartz mountain and Whisky hill in Tuolumne county; Carson hill and Chaparral hill in Calaveras county.



Each of these elevations owes its existence not to a greater uplift than the other hills of the region, but to the occurrence of large and massive veins of quartz and dolomitic rock, which are characteristic of this portion of the mother lode. These great masses of rock, which constitute a vein from 100 to over 300 feet in width, being of superior hardness, have resisted the erosive effects of the elements, and while the surrounding region suffered greater or less degradation these hard rocks, by their power of resistance to the destroying force, more ably maintained themselves while the neighboring rocks were being worn down, and now exist as hills of less elevation, showing that the topography of that part of the gold belt is due very largely to erosion, and not to superior uplift or to the intrusion and outpouring of volcanic rocks.

CARSON HILL FROM NEAR ROBINSON'S FERRY, CAL.

Carson hill, an engraving of which appears herewith, came into prominence in the earliest days of mining in California, by reason of the finding of several large nuggets of gold in the gullies which seam its sides. The hill comprises a group of hills, as it were, but all so intimately connected as to practically form a single eminence. The hill is ribbed with a dozen or more veins of varying width, some of them more than 100 feet wide, and all are gold-bearing. Thousands of feet of tunnel follow the veins into the mountain or crosscut its rocky ribs, which consist of a variety of rocks, the most important besides the veins of quartz and dolomite being diabase, amphibolite schist, serpentine, gabbro and black clay slate. The most active mining operations now in progress on the hill are those of the Melones Con. Mining Co., which is running a long tunnel into the mountain and building a 120-stamp mill in anticipation of developments in the future. Near the summit of the hill is the Morgan mine, on which in the early '50s was found a mass of gold ore said to have been worth $3,000,000. This occurred in a soft decayed talc schist, reticulated with veins and seams of quartz. The excavation from which the gold was taken, though caved somewhat, is now only about 30 feet square and of the same depth.

The excitement following this and other rich discoveries resulted in building up a settlement of several thousand people, but all traces of that early town have long since disappeared, and in its place, after years of inactivity, is now building a more substantial village near the works of the Melones Co.

THE last monthly statement of the Alaska-Mexican Mining Co. shows that the average of ore treated returned $1.69 per ton, the cost of mining and treatment being $1.348 per ton. This affords an excellent example of how low a grade of ore can be profitably mined and treated in that northern country, though the conditions obtaining on the coast of Alaska are better than are found in the interior, not only of Alaska, but in many places in the United States.

IN the rush which follows a new discovery in mining regions many things are done which would not occur in later years, when the excitement has subsided. Things go with a rush in stampede days; machinery is put in for which there is found no use; the character of the ore sometimes changes, and the outlook is not encouraging. Another strike in some other locality is reported and the old camp is deserted by all who can leave and its palmy days are over. In after years some one with more experience and better judgment sees great possibilities in the deserted mines and decaying mills and the life of the district is revived, when it is found that under the influence of advanced knowledge, improved methods and level-headed business management these were the only elements required to build up a substantial industry on the ruins of a stampede camp which was a failure.

STATE INSPECTOR OF MINES JOHN BYRNE of Montana, in his last official annual report, complains of the laxity of the managers of the large mining companies in observing the laws requiring greater care and attention to the life and health of the men employed in the mines, and urges that a commission be appointed by the Governor to draft a set of mine regulations defining as nearly as possible the duty of the mine owner, the duty of the miner, the responsibility of the mine owner, the responsibility of the miner, what the mine owner shall and shall not do, and what the miner shall and shall not do. These recommendations at once commend themselves to all miners, and such regulations in all mining States are surely a desideratum, but the mere passage of such laws, without giving the State Commissioner the necessary authority under penalty to enforce them, would be a loss of legislative time.

The Industrials and the Market.

Since January 1, 1899, there have been formed throughout the United States, but more particularly in Eastern cities, combinations of industrial, mining and other enterprises, the aggregate capitalization of which greatly exceeds two billions of dollars. These are the so-called trusts, though the individual concerns are known by many different names. The ostensible purpose of these consolidations is to control the production and sale of certain products and manufactures (and they embrace almost everything made in America), and thereby enable the manufacturers to secure raw material at better advantage and, by controlling the output, to obtain better prices in the market than is possible when competition cuts prices, and reduces the earning capacity of the several plants to a minimum. Incidentally, the favorable conditions obtaining under this method of consolidation and control are said to enable the employers to pay increased wages to the employed, and in many cases this has been done, though whether the increase in wages has been approximately commensurate with the increased profits arising from this method of conducting business is doubtful. One thing is evident—the past year has been one of the most prosperous the nation has ever known. Whether this prosperity is due to the trusts, or whether the trusts are the outgrowth of the great wave of industrial activity, affording an unusual opportunity for investment, is a question, though it appears that there has been a tendency for several years past to consolidate industrial concerns, and more recently mining and metallurgical enterprises have been included. Among these latter are found the Amalgamated Copper Co. and the American Smelting & Refining Co.

It is realized that, by merging several independent enterprises into a single concern having one general head or management, greater opportunities are afforded for money making and for the betterment of the great army of wage workers; but, unfortunately, this latter phase of the trust proposition is not greatly in evidence.

There is another feature of these trusts which affects the investors in stocks of these industrial aggregations, and that is the immense capitalization upon which trust "securities" are floated.

Half a dozen plants, situated in various parts of the country, costing, say, $10,000,000, earn when working independently $500,000 annually. This is about 5% on the cost of plant and floating capital. These several concerns are consolidated into a single company and floated at $60,000,000. Those who buy the stocks of this trust do so in the belief that it has a net earning capacity of at least 5%, or $3,000,000 per annum. It is to be anticipated that the consolidation of these several interests would cheapen the cost of production and insure an increased profit to the consolidated company on its products, whether of raw material or manufactured, but that it will do so to the extent of 50% per annum on the actual investment is more than doubtful, and that this is true is now beginning to be seen in more than a single instance.

For some time past warning notes have been heard from the more conservative financiers and the press, and on the 18th inst. an incipient panic shook Wall street to its foundations; further disaster was only averted by the prompt action of the "bears" themselves in stemming the downward rush of stocks by prompt and liberal buying; but that confidence has really been restored in those stocks known to be undeservedly high cannot be believed.

EASTERN business journals say "mining is the all-absorbing investment." Industrial stocks, State and county bonds, or county warrants are not so eagerly sought for investment purposes as formerly and the Eastern investor is learning that there is profit in the mining business when rightly conducted. Legitimate mining in this western half of America should receive impetus in 1900 from this volume of investment-seeking money, and fraudulent mining schemes should everywhere be exposed and discouraged on the same principle that counterfeit coinage or currency is condemned as being inimical to the common good. There will be considerable squeezing of watered stock in 1900, and consequent disappointment and distrust at the non-appearance of promised dividends from some of the big combines organized in '99. There will be a tendency to invest in mining, and, of course, a corresponding tendency on the part of some to unload undesirable mining property. Confidence is a plant of slow growth. It has taken a long time to educate the Eastern investor to know that mining is not a gamble; that it is a business, to be run on a business basis, and with the same industry, integrity and intelligence necessary for success in any business; and, rightly directed, the present tendency to more cautious investment in mining should receive the right kind of encouragement. The way to give the investor that kind of encouragement is to accord him square treatment throughout, and along that old-fashioned line lies the best success—best because surest and most mutually satisfactory—and in the long run most profitable.

What Constitutes a Valid Oil Location?

Judge Ross of the United States Circuit Court at Los Angeles, Cal., has decided that land which merely shows indications of mineral cannot be located as mineral land.

"Mere indications," says the Court, "however strong, are not, in my opinion, sufficient to answer the requirements of the statute, which requires, as one of the essential conditions to the making of a valid location of unappropriated public land of the United States under the mining laws, the discovery of mineral within the limits of the claim."

This decision was rendered in the case of the Sierra Nevada Oil Co. vs. the Home Oil Co. in favor of defendant, and, as far as this particular case is concerned, was just and proper, as the plaintiff had during a period of three years after location of the land in dispute failed to do any development or make improvements thereon. It was relocated by others, who sunk wells, finding oil in paying quantity, complying with the requirements of the law, and they were in consequence justly entitled to the decision as rendered by Judge Ross. The decision of the court, however, that indications, "however strong, do not constitute a sufficient ground for locating the land as mineral," can not meet with general approval.

In the location of a quartz vein, all that is necessary is an outcrop of a mineral vein in place. If the vein does not contain mineral in sufficient quantity to pay that is the misfortune of the locator. To the layman it would seem that if an outcrop of quartz or other mineral-bearing rock in place is sufficient evidence of possible value to make a location thereon legal, an exposure of oil sand or a seepage of oil should be considered sufficient evidence upon which to base an oil claim. The Federal Statutes do not require that a vein shall carry any given quantity of mineral per ton, but requires a bona fide discovery of "mineral bearing rock in place," nor should the court require that an oil claim yield a given number of barrels of oil daily before it can be recognized as a legal appropriation of mineral land under the statutes.

It would be interesting to know how "strong" the "indications" should be in a new oil region before a bona fide locator may consider himself safe in taking up an oil claim with any assurance that he could maintain possession of it under such conditions as determine the rights of a quartz vein locator.

The present situation seems to demand legislation, as oil-bearing formations are essentially different from metalliferous deposits, and the course which intending locators should pursue is not at all clear under existing laws.

IT should be understood that the decision of General Land Commissioner Hermann, issued the 15th ult., in the matter of lieu selections under act of June 4th, '97, or of lands selected in lieu of lands which have been deeded to the United States for forest reserves, also applies to State or railroad selections. Such selections cannot be made and approved within six miles of mineral claims of record without due notice by advertising for a period of sixty days, thus giving miners an opportunity to enter protest if the land be mineral in character. This ruling takes away no privileges of claimants of mineral land, but the land office will receive no affidavits as to character of land unless initiating a contest.

Concentrates.

A GALLON of sea water contains five ounces solid matter, principally salt.

NITRO POWDERS should be thawed slowly and not placed in direct contact with or near a high heat.

THE incorporated mining companies of Cripple Creek, Colo., have paid over $11,000,000 in dividends.

MALACHITE is the carbonate of copper. The specific gravity of copper is 8.95. It melts at 1996° F.

THERE is no United States duty on copper, tin or platinum. The duty on quicksilver is 7 cents per pound.

THE Boston & Montana Copper Co. of Butte, Mont., is producing copper at the rate of 75,000,000 pounds annually.

A WOODEN TAMPING BAR should be used in charging any kind of powder. In some States it is a misdemeanor to use a metal tamping stick.

THE Cox mine on Big creek and the Rudefeha mine at Battle lake, Carbon county, Wyoming, are at present the leading copper producers of Wyoming.

A "horse" in a vein is a piece of the country rock broken from one of the vein walls and afterwards surrounded wholly or in part by the vein stuff or gangue.

THE cyanide process was introduced in the United States in '91; the first detailed illustrated description of such use appeared in the issue of July 3rd, '92.

IT has been suggested that vacuum occurring in boilers when the steam pressure lowers may be avoided by placing a half-inch check valve in the top of the dome.

QUICKSILVER solidifies at 39° below zero, F., and volatilizes at 662° F. It is liquid at ordinary temperatures, showing this peculiarity with but one other metal—bromine.

THE largest gold nugget ever found in Colorado was one weighing 156 oz., taken on July 23rd, '87, from the Gold Flake mine on Farncomb hill, six miles east of Breckenridge.

THE telluride of nickel is reddish in color and is of rare occurrence. It is called melonite, named from the Melones mine, Calaveras county, Cal., where it was first discovered.

WATER dissolves its own volume of carbonic acid gas at all pressures at a temperature of 60° F. Ten per cent of this gas is dangerous to breathe, and 20% quickly produces asphyxiation.

NEVER fire a hole without some tamping. Wet holes require less care in this respect than dry ones. Moist earth with small fragments of rock or small gravel makes good tamping.

A LOCATOR who forfeits his location by reason of failure to perform assessment work can recover nothing for work performed or improvements made from his successor who legally relocates the claim.

NITRO POWDER should be kept in a cool, dry place. It deteriorates with heat and readily absorbs moisture, and if kept in a damp place, as in the workings of a wet mine, for some time its force is greatly weakened.

A STOPE filled with large waste at the time of extraction of the ore will settle but a few inches in 100 feet if no small material be employed in filling. The more care used in filling the less will the broken material settle.

THE cost of producing steam has decreased about 50% in the last thirty years. In '70 the Corliss simple condensing engine consumed twenty pounds of steam per hour for each horse power developed. Now the best types of compound engines need but ten and one-half pounds.

A HEALTHY man respires sixteen times per minute; each inspiration averages 34 cubic inches of air; 100 cubic feet of air will keep a man alive ten hours. One exhales about 22 inches carbon dioxide per minute; when at work, a man requires about 20 cubic feet of air per minute.

THE highest force detonators should be employed in blasting, as the powder explodes with better effect. XXXX caps are superior for this reason to XXX, and higher grades are still better, but should be handled with great care. Caps and powder should be kept separate, to avoid possible serious accident.

WHEN open excavations are left in mines subsidence usually follows, particularly if the vein lie at an angle approaching the horizontal. The subsidence will be greater or less according to the size of the excavation. The greater the depth of the excavation the less the subsidence will show upon the surface.

LIFE is too short to attempt correction of all the statements made in daily newspapers, "by telegraph," with a date line, etc., regarding alleged mine sales and discoveries. These meretricious items probably please those who secure their insertion, and are not believed by any one except those who want to be fooled.

IN Mexico ownership of mining lands is bounded by vertically descending planes; there are no overlapping claims. Anyone, native or foreigner, may take up unclaimed land, where practicable, in pertinenceas—squares 100 meters on each side. The "locator" pays an annual tax; failure to pay forfeits ownership and subjects the ground to relocation by some one else.

THE United States offers no bonus for the discovery of a tin or other kind of mine, though the mining laws are liberal and of a kind calculated to stimulate the search for and appropriation and development of mineral lands on the public domain. New Zealand has offered a bonus of £5000 on the first 100,000 gallons of mineral oil produced from shale, and a bonus of 4 shillings on each pound of quicksilver for the first 100,000 pounds of that metal produced in New Zealand.

"CONCENTRATES," in the issue of Dec. 2nd, said, substantially, that assessment work may be done at this time for two years—$100 worth of work in 1899 and $100 worth in 1900. That was suggested as a matter of convenience to those who have a long distance to go to perform assessment work, or where considerable expense attaches to the performance of the work from any cause. There is no law having a bearing on the matter. If $10,000 worth of work were done in 1899, not a single dollar of it in excess of $100 could be applied to required assessment work.

THE detonator or cap should be put at the top of a charge of nitro powder, and not in the center of the charge. The reason for this is that the fuse must burn down through the powder to the cap, and through some defect of the fuse the powder may take fire and burn or it may melt, and in either case its full force is lost in the discharge. By placing the cap in a short upper section of a powder cartridge, which is placed on top of and in contact with the main body of powder, the best results are obtained.

METALS, chemically, are usually grouped in four divisions, viz.: metals whose oxides are alkalies; metals whose oxides are earthy substances, as lime; metals whose oxides are earthy powders, insoluble in water; metals such as ordinarily are recognized as such, further divisible into two classes—common metals, iron, copper, lead, etc., combustible at high temperature, readily oxidable, rusting and tarnishing in air; precious or noble metals, gold, silver, mercury, platinum, not readily combustible, not tarnishing.

THE Montana State Legislature has prescribed that in that State "hereafter a cubic foot of water (7.48 gallons) per second of time shall be the legal standard for the measurement of water in this State. Where water rights expressed in miner's inches have been granted, 100 miner's inches shall be considered equivalent to a flow of 2½ cubic feet (18.7 gallons) per second; 200 miner's inches shall be considered equivalent to a flow of 5 cubic feet (37.4 gallons) per second, and this proportion shall be observed in determining the equivalent flow represented by any number of miner's inches."

IN a second a snail moves ½ inch; a man walking, 4 feet; a swift runner, 22 feet; an ocean wave, 24 feet; a carrier pigeon, 87 feet; a sixty-miles-an-hour locomotive, 88 feet; a swallow, 220 feet; a cyclone 380 feet; sound in the air, 1095 feet; the surface of the globe at sea level on the equator, 1500 feet; the moon, 3250 feet; the sun (apparent), 5½ miles; the earth, 18 miles; electric current on telegraph wires, 7000 miles; induction current, 11,040 miles; electric current in copper wire armatures, 21,000 miles; light, 180,000 miles; discharge of a Leyden jar through copper wire, 1-16 inch diameter, 277,000 miles.

CHUCKBLOCKS placed beneath the screen frame in a mortar are of service in creating a uniform discharge and treatment of ores. Those ores which have a natural tendency to slime should be worked with chuckblocks. As the die is worn down a high chuckblock is replaced with a low one, thus regulating the height of discharge and preventing to some extent the sliming of the ore which would result from continued pounding of the ore in a deep mortar. In some mills the chuckblock has a copper plate attached to its inner edge, in others it is fixed to a permanent block below the chuckblock. The former practice is the better.

ANSWERING R. R., Bisbee, Ariz.: Iron and manganese are not the same mineral, though not infrequently associated in the form of oxides of these metals. Pyrolusite is a soft manganese oxide brown, yellowish, reddish to black, and psilomelane is a hard ore (a hydrous manganese manganate), usually black or bluish black. Wolframite is tungstate of iron and manganese, as is also hubnerite, the latter containing 20% to 25% manganese oxide. These two latter minerals are entirely distinct from the manganese oxides before described. Manganese and the tungsten minerals are each employed in the manufacture of steel, and samples should be sent to steel manufacturers.

IF a person goes upon the mineral lands of the United States and either establishes a settlement or works thereon without complying with the requirements of the mining laws, and relies exclusively upon his possession or work, and a second party locates peaceably a mining claim covering a portion of the same ground, and in all respects complies with the requirements of the mining laws, then such second party is entitled to the possession of such mineral ground to the extent of his location as against the prior occupant, who is from the time said second party has perfected his location and complied with the law a trespasser. This is substantially the charge to the jury in Horsewill vs. Ruiz, 67 Cal., 111.

THE approximate height of a mountain can be determined by correct barometric observations. If, for instance, the barometer on top of Fremont's Peak, Wyoming, indicates 20 inches, when it is 30 inches at sea level, the altitude is 13,500 feet. The formula is: divide the product of 27,000 multiplied by the barometric reading at sea level, by the barometric reading at the altitude designated; from the quotient subtract 27,000; the remainder is the altitude in feet. For instance, if the barometric reading on the summit of Sierra Blanca Peak, Colorado, is 19.5 inches, the barometric reading at sea level 30 inches, then the height is

$$\frac{(27{,}000 \times 30)}{(19.5)} - 27{,}000 = 14{,}538 \text{ feet.}$$

THE San Francisco & San Mateo, Cal., Electric Street Railway Co.'s rails are welded together by electric process. A bar of steel 1x3 inches and 18 inches long, on which are three bosses—a boss being a projection of the metal on the side of a bar—is placed at each side of the rail web and the jaws of the welding machine allowed to grip it. A pressure of 1400 pounds is then applied by a jack connected to the upper end of the welding machine and the electric current turned on. Instantly the metal between the welder jaws begins to heat, showing bright until a welding heat is reached, when the current is immediately cut off, and, simultaneously, the pressure of the weld is increased to about thirty-five tons. Artificial means of cooling are then applied to the weld, that the cooling may be hastened while under pressure.

IT should always be borne in mind that in a mine possessing irregular streaks of high and low grade ores the latter are not rendered profitable by the admixture of the former. If the low-grade ore will pay alone, it should be worked; and, if not, the high-grade ore will not make it any richer. It often happens that an ore is too low grade to pay the cost of both mining and treatment, but will pay for treatment after having been mined. This ore should be reduced by mill, smelter or otherwise, and may be mixed with high-grade ore of otherwise similar character; but if too low grade to pay for treatment, should be used for filling, thrown over the dump or disposed of in some other inexpensive way. It also sometimes occurs that, when low-grade and high-grade ores are so intimately mixed in the vein as to render sorting expensive, it is cheaper to mill the whole mass than to sort it.

THE largest piece of gold ever unearthed anywhere free from quartz, of which there is any record, was that taken out of the Byer & Haltman mine, Hill End, N. S. W., May 10, '72. It was imbedded in a thick wall of blue slate 250 feet from the surface. It weighed 640 pounds, and was 57 inches long, 38 inches wide and averaged 4 inches in thickness. It was valued at $148,800. The Welcome Stranger nugget was found on Mt. Moliagel, Australia, Feb. 9, '69. It weighed 190 pounds and was valued at $45,000. The Welcome nugget was found at Bakery Hill, Australia, June 9, '59. It weighed 184 pounds 9 ounces and was valued at $44,856. The nugget found Aug. 18, '69, in the Monumental quartz mine, twelve miles north of Downieville, Sierra county, Cal., was the largest piece of gold ever found in California up to that date. It weighed 1142.25 ounces, or 95¼ pounds, cleaned, and was worth $21,156.52. It was found in decomposed quartz 25 feet from the surface.

AS TO WHETHER the top of a wheel goes faster than the bottom or just as fast, it may be said: When a wheel is put in motion every part of it starts at the same moment, and when its motion is stopped every part of it stops at the same moment, and the speed is uniform at every point. This is true whether the wheel is simply revolving on its axis or resting on the ground, though, in the latter instance, it has also a forward movement beside the circular movement around its axis. The forward movement is also exactly uniform in every part. The paradox can not be proven that "the bottom of the wheel goes backward or remains stationary for a moment while the top is going forward." In going forward the wheel, in one revolution, traverses a distance equal to its circumference. Every point on the wheel makes exactly the same distance, starting and stopping at the same distance with each other, which would not be the case if one part moved faster than the other—a thing impossible. The line described by any point in the circumference of a wheel moving on a plane, from the time it leaves the ground till it touches it again—in other words, making one complete revolution—forms a cycloid, and in making the next revolution every point on the circumference, whether at the top or bottom, continues forward at the same rate, starting immediately from where the last revolution left it. For a fuller explanation of this the querist is referred to the "Discussion of the Cycloid" in Church's Calculus.

THE distribution, size, and grade of battery plates is not uniform. An abundant plating surface is preferable in all cases where the gold is subject to amalgamation, and in the matter of grade there is some latitude. A grade suitable for one ore is unsuited to another. The quantity of water has also to be considered when determining the grade of plates. As to distribution and shape, wide plates—50 inches or thereabouts—are generally preferred to narrow ones. In some mills the pulp falls from the battery screen upon a plate of iron, in others upon a rough plank, but a good copper plate well plated with silver is superior to either of the former. The argument against the use of the copper plate is that the dashing fall of the pulp scours the plate. It does, and at the same time accumulates amalgam. A plate arranged in a series of drops is not objectionable. The drop of each section should be about 2 inches. These plates may be 2 or 3 feet wide. A 12-foot plate will then have a series of five or three drops. It will be found that under the drops amalgam will accumulate. The scouring keeps the quicksilver active and bright and furnishes a practical illustration of the advisability of frequently dressing the plates. After plates are dressed the mercury lies in a series of fine parallel ridges, this being produced by the brush used in dressing them. When the pulp has passed over the plates for several hours the depressions become clogged with an extremely fine but heavy material consisting of sulphides contained in the ore, fine particles of iron worn from the shoes and dies and other minerals of high specific gravity, and the surface available for gold saving becomes reduced thereby and the quicksilver becomes inert. When in this condition the plates need dressing, for they are not doing good work, though they may look bright.

ANY steam boiler may be exploded by overpressure such as might be caused by the combination of an inattentive fireman and an inoperative safety valve, or by corrosion weakening the boiler to such an extent as to make it unable to resist the regular working pressure, but some boilers are more liable to explosion than others. In considering the probability of explosion of any boiler of recent design, it requires study as to the probability of its having any of the features known to be dangerous in the plain cylinder, the horizontal tubular, the vertical tubular, and the locomotive boilers. The plain cylinder boiler is liable to explosion from strains induced by its method of suspension, and by changes of temperature. Alternate expansion and contraction may produce a line of weakness in one of the rings which may finally cause an explosion. A boiler should be so suspended that all of its parts are free to change their position under changes of temperature without straining any part. The circulation of water in the boiler should be sufficient to keep all parts at nearly the same temperature without straining any part. Cold feed-water should not be allowed to come in contact with the shell, as this will cause contraction and strain. The horizontal tubular boiler, and all externally-fired shell boilers, are liable to explosion from overheating of the shell, due to accumulation of mud, scale or grease on the portion of the shell lying directly over the fire, to a double thickness of iron with rivets, together with some scale, over the fire, or to low water uncovering and exposing an unriveted part of the shell directly to the hot gases. Vertical tubular boilers are liable to explosion from deposit of mud, scale or grease upon the lower tube sheet, and from low water allowing the upper part of the tubes to get hot and cease to act as stays to the upper tube sheet. Locomotive boilers may explode from deposits on the crown sheet, from low water exposing the dry crown sheet to the hot gases and from corrosion of the stay bolts. Double cylinder boilers have exploded because of the formation of a steam pocket on the upper portion of the lower drum, the steam being prevented from escaping from out of the rings of the drum by the lap-joint of the adjoining ring, thus making a layer of steam about ¼ inch thick against the shell directly exposed to the hot gases.

The Cripple Creek Gold Field.*

NUMBER II.

Written by T. A. RICKARD, State Geologist of Colorado.

The Cripple Creek district exhibits a great variety of vein structure. Many of the veins are essentially mineralized dykes, that is, a part, or even occasionally the whole width of the dyke, is sufficiently rich to be regarded as pay ore, and the boundaries of the dyke then become the walls of the lode. The Moose vein will exemplify this type. The accompanying sketch, Fig. 4, was made at the 350-

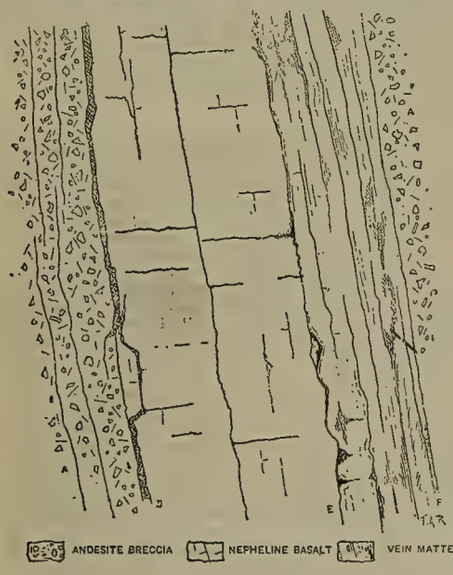

Fig. 4.—Cross-Section Vein, Moose Mine, Cripple Creek, Colo.

foot level. From *D* to *F* is the width of the dyke, which in this case is nepheline basalt, which traverses the andesite breccia. The pay ore extends from *E* to *F*, a width of 10 inches, and it is distinguished from the remaining comparatively barren portion of the dyke, a dark bluish gray rock, by being iron stained and seamed with reddish brown threads, in which gold and tellurides occur. The multiple fracturing, parallel to the walls of the dyke, is a characteristic feature of such lodes, and experi-

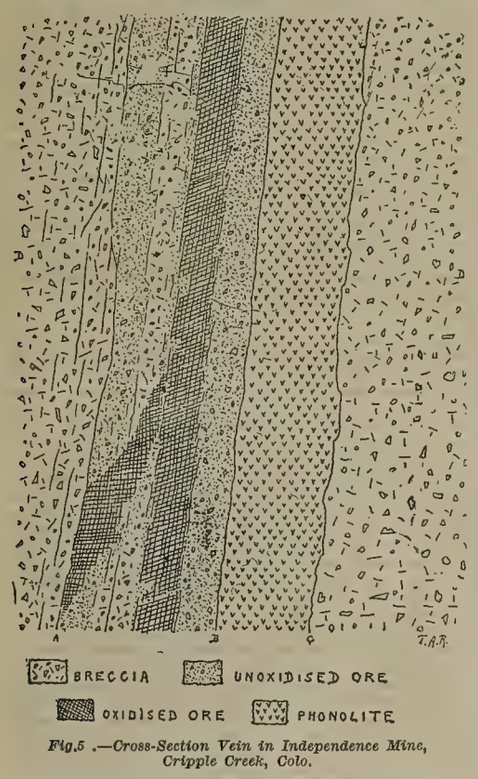

Fig.5 .—Cross-Section Vein in Independence Mine, Cripple Creek, Colo.

ence has shown that there is reason to expect the lode to consist of rich ore when it becomes threaded with minute seams following these lines of fracture. This feature can be described as a sheeting of the rock; it is a very important factor in ore deposition.

Another type is presented by those veins which accompany the phonolite dykes. This is very characteristic of the Cripple Creek district. The direction followed by a majority of the veins, especially on Battle mountain and Bull hill, conforms to that of a system of phonolite dykes. While a particular vein may not adhere continuously to the line of the dyke with which it is associated, nor the ore itself be found in the substance of the dyke, when they are together, yet the behavior of the vein is intimately connected with that of the dyke, and the ore occurrence is modified by both. Fig. 5, made in the Independence mine, will illustrate this. The lode, *AB*, is shown to be in breccia, and follows a phonolite dyke, *BC*, which is 2 feet wide. The ore is confined to the breccia, and if the phonolite is enriched it is so to a slight extent only, and the enrichment is confined to the planes of fracture near the lode and does not extend into the body of the dyke. The ore is essentially andesite breccia, rendered gold-bearing by the penetration of solutions which have circulated along the line of contact between the phonolite and the breccia. The gold occurs not only in the seams which follow the fracture in the breccia, but it is also found in the heart of it, where a spongy vesicular appearance has been caused by the removal of the more soluble ingredients of the rock.

In striking contrast to the two types above described I would instance those veins which are neither mineralized dykes nor immediately (emphasis is laid on "immediately" because the Independence vein, for a large part of its known course, accompanies a phonolite dyke) associated with them, but consist essentially of lines of fracture in the body of the granite itself. A good illustration is afforded by the Independence vein when it leaves the breccia and extends southward into the granite of the Washington claim. Fig. 6 was made at the bottom of the

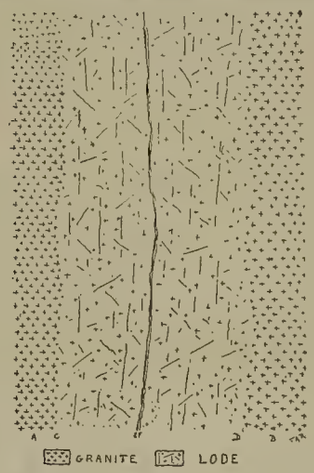

Fig. 6.—Gold Bearing Granite in Washington Mine, Cripple Creek, Colo.

old whim shaft on the 100-foot level. The lode is decomposed granite divided into two equal portions of 2 feet each on either side of the small seam, *EF*, which consists of a parting, *E*, marked by a slight clay selvage, and a seam of quartz, *F*, which is only from ¼ inch to ½ inch thick, but very regular and continuous. The lode, which here consists of 4 feet of two ounce ore, has no walls, that is to say, the decomposed gold-bearing granite, *CD*, is not separated from the undecomposed valueless granite, *A* and *B*, by any clearly defined boundary, although the transition from the dark brownish granite into the fresh pink rock can be clearly followed by looking at it from a distance of 5 or 6 feet. The ore is, therefore, essentially gold-bearing granite, which is found to have undergone several changes, the most notable being the removal of the mica, the decomposition of the feldspar, and the addition of secondary quartz, the general effect being to give it a honeycombed, spongy character.

The lode above described is similar to the outcrop of the Independence mine, which so many overlooked in 1890 and 1891, because it carried no visible metallic minerals or free quartz. The lode has undergone weathering, yet it has withstood the elements, because it carries more quartz than the surrounding rock. The outcrop ceases to appear at a point now occupied by the No. 1 shaft of the Independence mine. This shaft is situated at the contact of the granite and the breccia. The lode continues northward for a great distance, as the workings testify. Southward the lode is encased in granite, and it is itself composed of granite. The barren outer rock is pink in color, and its constituent minerals present a fresh, unaltered appearance. The gold-bearing portion, comprised within the lode, has a dull brown tinge. It is noticeable that the mica is absent, having evidently been leached out, leaving patches of chlorite and iron-stained spots, in which free gold can occasionally be distinguished. Of the two feldspars (orthoclase and oligoclase; the plagioclase variety, containing a larger percentage of lime, is the one which has undergone decomposition) of the original rock the more soluble has become kaolinized, while the other remains so undecomposed as to preserve much of the usual appearance of the granite. The original quartz has been removed, probably by the action of the hydrofluoric acid, the presence of which at one time is suggested by the purple fluorite now staining portions of the ore. Further, there is abundant secondary quartz, in groups of opalescent, indistinct crystals, to the presence of which the lode owes the fact that it is harder than the enclosing granite.

When the lode penetrates the breccia it continues to be made up, not of free quartz or any other foreign vein matter, but of the formation which it traverses, so that south of the contact the Independence is essentially gold-bearing granite, and north of the contact it is gold-bearing andesite breccia.

It is remarkable that while the several bands of gold-bearing matter have a general parallelism with the course of the two phonolite dykes, yet a large part of the ore is not contiguous to the phonolite, but traverses the granite and the breccia, regardless of such structural features as the contact or the dykes themselves. The ore has no defined walls. When definite partings appear to limit the widths of gold-bearing material it is only to mislead; there are simlar "walls" both within the ore itself and beyond it in the outer country. When the ore abuts against a phonolite dyke it does not usually extend into the dyke, save occasionally where tellurides are found upon the cleavage planes of the latter near its edges. Where the lode crosses the contact the ore changes at once from gold-bearing granite to gold-bearing breccia. A widening of the ore body exists at the contact, and for a considerable distance both north and south of it. The composition of the rocks appears to have been an entirely unimportant factor as compared to the physical and structural conditions in the locality of the ore deposit. Few examples of lode structure so well emphasize the general truth of those modern ideas of ore deposition which are advocated by the teachings of Posepny. It is interesting to accentuate this fact, because there was an erroneous impression conveyed, in the early days of Cripple Creek, by the writers of the daily press, that the gold field set at naught the accepted teachings of geological science. The idea was due to the careless utterances of local men, and never emanated from any recognized authorities. The converse is true, and should be emphasized, namely, no modern mining region so clearly establishes that explanation of ore deposition, which is based upon the recognition of the laws governing the circulation of underground waters, under conditions traceable to the geological structure of the rocks.

The Ores and Minerals.—In discussing the geological feature of the district frequent emphasis has been laid upon the fact that the ore is usually only rock, whether granite, phonolite or breccia, which has become impregnated with gold-bearing minerals to a slight extent as regards percentage, but to a notable degree as regards commercial value. In 1893, when W. S. Stratton, the owner of the Independence, sent several carloads of rich ore from his mine to the Denver smelters, the officials at the works thought a blunder had been made and that loads of ballast had been inadvertently consigned to them.

The gold occurs either in the native condition or as a telluride, and is found distributed among the interstices of the rock, lining the fractures or penetrating the substance of it in threads of varying minuteness. In lodes traversing the granite the gold, or the tellurides containing it, will be scattered amid the porous cavities due to the removal of certain more soluble portions of the rock. In phonolite the values will be found more frequently along fractures than in the heart of it. This renders the last mentioned class of ore very difficult of estimation. In the andesite breccia, the component fragments of which are so heterogeneous, the physical character of the rock varies considerably, and the gold values will partake of an irregular, sporadic distribution.

The distinguishing feature of the ores of the district is the occurrence of tellurides. The tellurides are compounds of tellurium with certain metals, and they are so termed just as the compounds of sulphur are called sulphides; thus, for example, calaverite is the telluride of gold, while iron pyrites is the sulphide of iron. Tellurium is a non-metallic element with a metallic luster. It acts as an acid base, just as selenium and sulphur, the three forming a recognized chemical group having common affinities. If tellurium were a metal, as is often supposed, its combination with gold or silver would only be possible as an alloy.

It is usually assumed that the precious metals enter into the composition of tellurides, and a high commercial value is taken for granted in speaking of this species of minerals. Nevertheless, there are many varieties which are valueless to the gold miner, such as telluride of mercury, called coloradoite, which occurs at Kalgoorlie, as well as at Magnolia in Boulder county, Colorado. The tellurides of the baser metals occur, for the most part, in quantities so restricted as to have no commercial value, and are rather to be considered as curiosities much desired by the mineral collector.

No native tellurium has yet been found in the Cripple Creek district, but in Boulder county, ninety miles farther north, it occurs among gold ores in a free state, and a mass weighing twenty-five pounds was found in the John Jay mine about twenty years ago.

Certain telluride materials very much resemble

*Condensed from a paper recently read before the Institute of Mining and Metallurgy.

the common ores of silver; the sulphide of silver (argentite), for example, is difficult to distinguish from hessite, the telluride of the same metal, silver. The instance is quoted in order to refer to a simple test applicable to any doubtful cases. Remove a small bit of the suspected mineral with the point of a knife, and put it in a porcelain dish or a white saucer. Add three or four drops of strong sulphuric acid, and heat over a lamp. Should tellurium enter into the composition of the suspected mineral, a beautiful purple will suffuse the colorless acid.

The principal telluride minerals found in the Cripple Creek ores are sylvanite, calaverite and petzite. Sylvanite, named after the place of its discovery, Transylvania, is the most characteristic of Cripple Creek ores, an average composition being 28% gold, 16% silver and 56% tellurium. Sylvanite is a brilliant silvery white mineral, having a characteristic crystalline habit, to which it owes its other name, "graphic tellurium," the arrangement of the crystals resembling Arabic lettering.

Calaverite is the simple telluride of gold. Pure specimens contain 44.5% gold and 55 5% tellurium. It is named after the county of Calaveras, in California, where it was first found at the Stanislaus mine. The purest varieties are bronze yellow color. Calaverite is rather difficult to distinguish from iron pyrites. The difference in color is slight, but the former is easily cut with a knife, while the latter will not permit of it. The cubic crystalline habit of pyrites will usually help to make it known, because calaverite rarely occurs in any other than a massive form.

Petzite, named after the German chemist, Petz, is, like sylvanite, a double telluride of gold and silver, its average composition being 25% gold, 42% silver and 33% tellurium. It is much darker than sylvanite, being steel gray to iron black; it is also slightly harder and more brittle.

The lodes of Cripple Creek are further characterized by the presence of fluorite or fluorspar (the fluoride of calcium), a purple mineral, which is so notably associated with the ores of the district as to have led to the idea that it could be accepted as an indication of the richness of the veins in which it was found. But, like most attempts at short cuts to knowledge of this kind, the generalization has proved fallacious. There are several large lodes of low-grade ore in the district which are purple with fluorite, and there are some very rich ores almost devoid of it.

In the upper levels of the mines, within the reach of surface waters, the tellurides are decomposed and the gold has been liberated. In the first years of development certain mines afforded specimens of native gold, the dull brown, lusterless appearance of which was a puzzling variation.

Below the depth, which ranges from 100 to 400 feet, reached by surface waters, the unaltered tellurides appear in all their untarnished beauty. At a further depth, from 500 to 700 feet, the ores become more complex, because of the increasing percentage of baser minerals, chiefly iron pyrites, but including also galena and stibnite. This change is important chiefly from a metallurgical standpoint, because the increase of sulphur renders the roasting of the ores more expensive.

(*To be Continued.*)

Types of Veins.

The terms simple fissure vein, group of parallel veins, linked veins, and chambered veins probably include nearly all species of deposits excepting sedimentary beds and placers, writes G. F. Becker in his monograph on the Quicksilver Deposits of the Pacific Slope. It is, of course, easy to imagine irregular bodies of ore unconnected with any fissure system, but it is doubtful whether such really occur in nature. If these terms should be adopted, the names impregnation, stockwork, pocket, etc., would be understood to refer only to the structural character of the specific portions of deposits, and not to the form of any deposit as a whole.

While it appears that even veins in firm, homogeneous rock must tend to irregularity near the original surface as it existed when the fissure formed, it is evident that at great depth fissures in irregular and weak rocks, such as those which form the greater part of the Coast Ranges of California, must tend to regularity and simplicity; for at great depths the walls of a fissure are so supported by the overlying masses that even if the country is composed of discrete fragments these will be held in place very much as if the material were continuous. Hence at considerable depths distinct fissures are to be looked for, even in the quicksilver mines; but it is evident that the material support of fragmentary rocks will act only so long as the fissures are very narrow. If considerable openings form, such as are suitable for the deposition of ore in large masses, irregular reticulated vein chambers will result in such material at any depth. In such rocks as I have seen in the quicksilver mines of California wide simple fissure veins are not to be expected at any level, and irregular chambers are not so likely to be met with at great depths as at small ones, though they may occasionally be found at any distance from the surface.

Three-Quarters of a Century's Progress in Mining and Metallurgy.*

Written by CHAS. KIRCHHOFF, New York.

It is difficult to measure progress, qualitatively, in branches like mining and metallurgy. It is expressed in the more complete utilization of the natural resources, as in the increase of the total extraction of the contents of a coal bed. It is in evidence in the form of a capacity to utilize bodies of ores, lower and lower in grade. It is proven by ability to produce from rebellious, or impure ores, metals nearly chemically pure, and commercially available for a wider and wider range of consumption.

A simple enumeration of statistics of production only partially reflects the development of an industry. Yet that in itself shows a record of which we may well be proud.

Practically seventy-five years ago our greatest mining and metallurgical industries were in their infancy, and many were not even started. We had only begun to mine small quantities of anthracite coal. We were producing iron, but had at an earlier date been relatively more important as an iron-manufacturing nation. Silver, copper and lead were made in irregular, very small quantities. Zinc was not produced, and the gold output, with the Georgia gold rush of '28–30, was about to begin. In other words, our mining and metallurgical industries were of so limited a character that, compared with the ancient operations of the leading European nations, they were insignificant to a degree.

While it is true that our miners and smelters rose to the occasion when they were called upon to meet special conditions, the general fact is apparent, from a study of our development, that we first copied and then adapted the methods approved by experience in Europe. We were forced and did create hydraulic mining to collect the gold from alluvial deposits. We developed the preparation of anthracite for the market. We had nothing to guide us in handling the copper rock of Lake Superior. The Washoe process was worked out to treat the silver ores of the Comstock lode. There were few precedents for methods in the petroleum industry, and had to learn by ourselves how to collect, distribute and utilize natural gas. But Cornish, Welsh and English miners long controlled the working out of our mining methods. German and English metallurgists guided our first steps in beneficiating our more complex silver, lead and copper ores.

Mining.—With the widespread search all over the world, and the increasing number of trained observers, there has been an enormous accumulation of observations and data relative to mineral deposits. In the case of bedded deposits, the relations between mining development and economic geology have become closer and closer. But, on the whole, it cannot be said that this branch of science has given much direct aid to the metal miner. The systems of extraction have not undergone any radical improvement. On the whole, they are modified more frequently to meet more closely local conditions. It is rather in the work of excavation proper that progress has been most striking. It was J. J. Couch, a Philadelphian, who, in '49, patented the first percussion drill ever made. Herman Haupt experimented with rock drills at the Hoosac Tunnel, from '56 to '61, while the first drill tried in mining was that of Schumann, at Freiberg, in '57.

Colladon had proposed to use compressed air to work drills as early as '52, but general attention to rock drills driven by compressed air was attracted by their employment at the Mount Cenis tunnel in '61, the plan to adopt them having been approved in '57, as the result of Sommeiller's work. Quickly following upon the start thus made by power drills, came the introduction of high explosives. Nobel first applied nitroglycerine in '63, and its use was begun in '66 at the Hoosac Tunnel. A year later Nobel introduced dynamite, and since then power drills and high explosives have wrought a complete revolution in mining, by increasing the speed of development and extraction, by very greatly increasing the efficiency per man employed underground, and by heavily reducing the cost. By constant improvement in design and detail of both compressor and drill, machines have been created which have a wonderful life and efficiency, considering the adverse conditions under which they are expected to operate. What the defects in design in the early days meant is illustrated by the fact that in '64, in the Mount Cenis tunnel, it took an equipment of seventy Sommeiller drills to keep eight steadily at work, and in '67, 200 were needed to maintain sixteen in actual operation.

The mechanical engineer and machine builder have given their powerful aid, too, in improving pumping and hoisting machinery. The simple and effective American direct-acting pump has done valuable service to mining, although for heavy service and large quantities of water it is giving way to more elaborate engines. In hoisting appliances for deep mining we long remained behind European practice, our shallow mining not calling for heavy engines. During the last decades, however, some splendid equipment in magnitude, in speed and in economy of operation has been designed in this country.

Underground traction has undergone far-reaching changes. Wire-rope haulage was introduced into collieries long before San Francisco led in surface cable traction, and in this country pneumatic and electric haulage were very promptly adopted and very rapidly developed. These, however, are only recent achievements, progress in underground haulage having been very slow for decades.

In timbering the Comstock, square set was a characteristically American creation to meet exceptional conditions, and it is true that the preparation of mine timbers above ground by machinery was first practised in this country.

For a long time the concentration of ores was neglected, simply because in many remote sections of the United States it did not pay to turn to mechanical dressing, and because the oxidized surface ores, easily smelted, did not offer opportunities. An exception must be made of the Lake Superior copper region. There the Ball steam stamp quickly superseded the time-honored battery. Subsequently, Leavitt reduced the steam consumption by compounding, and more recent practice has proven that the spring foundation is not equal to the solid anvil in bringing out the highest efficiency. Ore concentration has been well developed in later years in southeastern Missouri and the low-grade lead and copper camps of Colorado, Utah, Idaho and Montana.

It would be a serious oversight, in dealing with the treatment of ores, to overlook the enormous influence which the introduction of the Blake crusher has wielded in the efficient handling of rock. Nor should later types of crushers, like the Gates, be overlooked.

An example of steady progress in crushing apparatus is furnished also by what is known as the California stamp mill. Every detail has been watched and worked out for decades, and a number of efficient self-feeding appliances have been added, until to-day there are enormous plants pounding away year in, year out, without any intermission, with merely a crew of inspection to represent the labor account.

It seems certain that the part which the rock drill has played in general mining is destined to be paralleled in coal mining by the modern coal cutting machinery. The difficulties inherent in handling mechanical apparatus in low rooms may account for the fact that progress has apparently lingered so far behind in this field. In Europe, as well as in this country, inventors took hold of the problem in the '50s, but little headway was made for many years. It is only recently that machinery for this purpose is being introduced with a rush. Among the pioneers were Harrison, with a pick machine, and Lechner, with a cutter-bar machine. All the earlier types were driven with compressed air, and it was not until '89 that electricity was applied to the Jeffrey cutter-bar machine, since superseded by the electrically driven chain-breast machine. How rapid has been the development of this branch of work in this country in recent years is shown by statistics compiled by E. W. Parker of the United States Geological Survey. In '91, 6,211,732 tons of coal were mined by machines representing 6 66% of the whole. In '98 the tonnage had jumped to 32,413,144 tons, or 20 4% of the whole. It is not too much to say that, from an economic point of view, this is the most far reaching and significant recent development in mining.

A splendid achievement in mining was that of handling auriferous sands by hydraulicking. I do not remember ever having noticed in our literature any definite data which might fix the credit for this upon any one man or group of men. The date is placed at about '53, and in those stirring times, so soon following the discovery of gold in California, probably no record was left. The further stages of its development are coupled with the names of a number of inventors of nozzles and many ingenious hydrodynamic and hydrostatic contrivances, and in its greater days, before the anti-debris laws in '82 cut off the work, bold and splendid engineering work was done in connection with these undertakings.

In more recent times some very thorough work has been done in one branch of ore dressing, and that is in magnetic separation of iron ores. A number of American inventors—among them Ball & Norton, Wenstrom, Wetherill and Edison—have labored to utilize the lower grades of magnetites in the Eastern States. The problem of cheap and effective crushing involved has been carefully studied and brought out new ideas, but economic conditions for a while pushed the whole undertaking into the background. Recent events point to fresh opportunities in this direction.

Metallurgy.—In the metallurgy of the precious metals marked progress has been made, although no really revolutionary methods have come to the front until the present decade brought the cyanide process. In gold extraction the improvement in the California stamp mill, largely mechanical, has already been alluded to. There have been added, in

*Condensed from the Journal of the Franklin Institute.

the amalgamation process, some ingenious contrivances. The chlorination process, together with the improvement in the design and operation of the batteries, and the introduction of the Frue vanner and machines of its type, has rendered possible the profitable treatment of low grade ores. There are to-day prosperous enterprises based on a yield of one-tenth of an ounce of the yellow metal to the ton of rock—a quantity so minute that no gold is visible in the ore, week in, week out.

The chemist has again intervened in recent years. While the solvent power of cyanides on gold was known early in this century, it was not until the later '80s that the MacArthur-Forrest process made that method practicable by utilizing the fact that zinc shavings may be used as a precipitant.

For the treatment of more complex ores there was developed relatively early, at the Argo Works, in Denver, Colo., a series of methods dependent upon the employment of copper as a carrier, and more recently pyritic smelting is gaining ground. It is based upon the treatment of sulphide ores in the blast furnaces, so that a considerable part of the heat produced by their oxidation is utilized in their fusion. Small quantities of lead or copper serve as collectors of precious metals.

Silver.—Although the patio process of amalgamation was invented in 1557 by Bartolome de Medina, at Pachuca, followed in 1590 by the cazo process of amalgamation invented by Alonzo Barba, at Potosi, no real improvement followed in the succeeding centuries. On the heels of the discovery of the Comstock lode, in '59, by O'Reilly and McLaughlin, came the invention of what is known as the Washoe process of amalgamation, by Almarin B. Paul and James Smith. It was in the direction of improving the chloridizing roasting that metallurgists sought and found a solution of their troubles. Brueckner, Stetefeldt, Howell, O'Hara and others did admirable work; but with the steady improvements in lead smelting, increasing quantities of the rebellious silver ores were diverted from the amalgamating mills to the smelters, and now silver milling has shrunk to a secondary place.

Lead.—Although lead mining was begun as early as in the days of Law's famous Mississippi Co., and Mine La Motte, in southwest Missouri, still in active operation, was discovered at that time, yet production did not develop seriously until late in the '20s. It attained about 10,000 tons per annum in '33. With the rich and pure ores the Scotch hearth served admirably and remained the standard method until the discoveries in quick succession of the rich ore bodies of Eureka, Nev., and of different camps in Utah, late in the '60s, led to the copying of the German blast furnace practise. Arents, Eilers, Hahn, Grant and others soon introduced improvements, Arents' siphon tap being a very important step forward. Water jackets appeared and a thorough scientific study of the chemical composition of slags led to more regular and cleaner working, and the collection of flue dust assumed a growing importance, Iles, of Denver, Colo., doing conspicuous work in this direction. Charcoal as a fuel gave way to coke—the quantity of lead in the smelting charges needed to recover the precious metals was steadily crowded down under the pressure of a scant supply of lead-bearing ores. With the steady development of the railroad system of the Rocky mountains, dry ores carrying little or no lead became available in larger quantities, and to-day American lead smelting plants are models for the world.

Soon after the argentiferous base bullion of the Rocky mountains made its appearance, the Parkes zinc process, invented in '52, was first introduced at the Balbach Works at Newark, N. J., and the most important improvement in it was that of the Faber du Faur furnace for distilling the rich zinc alloy. Since then progress has taken the direction of economic handling of large charges and the introduction of labor-saving appliances.

Copper.—Although some copper was mined along the Atlantic coast at a number of points in the eighteenth and during the earlier part of the present century, it was not until the gradual opening up of the Lake Superior region from '45 onward that it attained the dignity of an important industry. Curiously enough, it was in the same year that the smelting industry on the seaboard was started by the Revere Copper Co. and the Baltimore & Cuba Smelting & Refining Co; both depended almost entirely upon foreign supplies of raw material. These flourished for about twenty years and then collapsed or led a precarious existence until domestic supplies of furnace material from the Rocky mountain region caused their revival. To-day our tide-water plants are among the great works of the world, and have begun to again draw heavily from foreign sources. Thus, Australian black copper comes to us via London for treatment, to be returned to the European markets, and Chili bars are making the same journeys. Metallurgically, there is little to remark concerning the development in the treatment of the native copper of the Lake region, which held sway in the markets for so many decades. The time-honored methods of refining continued with little change.

A new era began with the opening up of the oxidized deposits of Arizona and the ores of the Butte district. In the former the water-jacketing of the furnaces was one of the first successful steps, and a general improvement of practise followed quickly. In the Butte district a good deal of tentative work was done in concentration, in roasting and in smelting in reverberatories and in blast furnaces. The Brueckner, Brown and Wethey roasting furnaces were adopted, and the Manhes process of bessemerizing, invented in '83, in France, was first introduced at the Parrot Works. The practise has been improved very rapidly, and now the remelting of the matte is being superseded by direct transfer from the furnace to the converter. Almost simultaneously came the electrolytic process of separating the precious metals, in which very rapid progress has been made, and which, coupled with the bessemerizing, an economic revolution has been effected, not alone in cost of production, but also in the direction of furnishing a high-grade metal from impure ores.

Iron and Steel.—And now we approach the greatest of all metals—iron—in the development of which Pennsylvania has had so conspicuous a share.

After all, it was not until the days when John Fritz became a leader that the marvellous development was initiated. Remember that it was not until '39 that anthracite was used in the blast furnace, and that six years later raw bituminous coal was tried in this country as a furnace fuel. You must recall that boiling was only introduced in '48, that our modern steel making processes did not really occupy a commanding position until late in the '60s, and you will realize that the great period of the iron industry is really concentrated in the last thirty years.

One fact perhaps you will allow me to dwell upon, and that is, that the Bessemer process really forced a recognition of scientific work upon the attention of the practical ironmaster. The chemist very soon became a part of the force of the steel works, and, somewhat later, of the furnace plants, who were anxious to have them as customers for pig iron.

Not that chemical research had not long since been directed to metallurgical operations, and not that a few did not indulge in speculations as to the scientific causes of observed phenomena.

But progress during the last seventy-five years has been pushed along lines as important in their way, as the cheapening of product, or the raising of the standard of quality. Like in other industries, the captains have displayed increasing care of their armies of men. It has become an axiom with every enlightened manager that every means which shall render more satisfactory the surroundings of the workers is bound to tell upon the results of their labor. Compare our modern plants with those of former decades, of which some even survive now, and note what attention is paid to make the conditions under which manual labor is performed as tolerable as the circumstances will permit. There has been a tremendous improvement in this direction, and it does not lessen the achievement when we frankly acknowledge that it is largely due to the recognition of the fact that progress in this direction pays handsomely.

It was the keynote of Franklin's life that all his thoughts and all his endeavors were directed to making his work of benefit to the human race. Although those who have labored in our fields may not have done so as consciously or as deliberately as he, the fact is that progress in mining and metallurgy has powerfully contributed toward that end.

American Inventive Genius.

"The Patent Office is more than self-sustaining," says Secretary of the Interior Hitchcock in his annual report. "As American inventive genius has cheapened the cost of production, to the advantage of American wages, it would seem as though the legislative branch of the Government should do much to encourage the useful arts and the inventors of the country. At the present time our manufacturers are reaching out for foreign markets, and no greater aid can be given them than by fostering and stimulating invention to become dominant in the markets of the world through labor-saving inventions which will enable it to compete with the lower wages paid to the so-called working classes in other countries. The greatest development in American exports must be in the direction of increase in the export of manufactures. The commissioner asserts that we mainly owe to our patent system such foothold as we have gained during the past fifty years in foreign lands for our manufactured products; that we can, by a fair and liberal treatment of our inventors, control for our manufacturers not only our home markets, but the markets of the world. Most labor-saving machinery perfected within the last seventy-five years is the invention of our own people. It is not alone by fundamental inventions that our inventors have revolutionized in so many respects the manufacturing industry. Not the less have their inventions in automatic devices, in expediting processes and in many steps dispensing with hard labor, assisted in placing this country in the front rank in art. American electrical appliances command the world's markets. Let it not be forgotten that it is the American inventors who, by their inventions and discoveries, 'have made the last fifty years of the nineteenth century the most remarkable of recorded time,' and, at the same time, have laid the civilized world under tribute to American manufactures."

Ore Shoots—Ore Chimneys—Pay Shoots.

Written for the MINING AND SCIENTIFIC PRESS by J. P. WALLACE.

The above terms are practically the same in meaning. They may be defined as collections of the most valuable ore into continuous channels, troughs or expanded portions of a vein. Isolated ore bodies of this kind are generally called chimneys. Ore shoots may be vertical, more or less inclined or horizontal. One or more may occur in the same claim. When several are thus found in one vein they are generally parallel, or nearly so, and are separated from each other either by pinched portions of the vein or by ore that is comparatively low in grade or too poor for extraction. The distance between shoots varies in different cases—it may be but a few or many feet. The width of shoots, either crosswise or lengthwise to the vein, differs greatly in different shoots and also in different places in the same shoot; the width along the vein varies from a few feet to several hundred feet; the width crosswise to the strike generally corresponds to the distance between walls, except in those cases where the walls are impregnated or replaced with valuable ore. There is no regularity as to vertical extension of shoots or chimneys; sometimes they are less than 100 feet, at other times over 1000 feet and in rare instances over 2000 feet. Shoots often outcrop, but sometimes are blind—that is, covered up with debris or country rock. Occasionally they are encountered in the workings several hundred feet below the surface. The kind of ore in shoots differs; it may be chiefly gold, silver, copper or lead, or it may be a mixture of these. The grade of ore may and generally does vary in different parts of the same shoot; so, also, different shoots in the same lode often carry different values. A lode which is characterized by the occurrence of shoots should be so worked as to confine the development as much as possible to the ore-bearing ground; thus, a shaft in a perpendicular and a drift in a horizontal deposit of ore would in most instances be the economical method.

At or near the point of crossing of two veins, especially if the veins intersect at a small angle, shoots are of common occurrence, and the ore in such deposits is generally richer than in other ore shoots of the same vein. Shoots of ore occurring at vein intersections are occasionally the only ones found in the two fissures concerned.

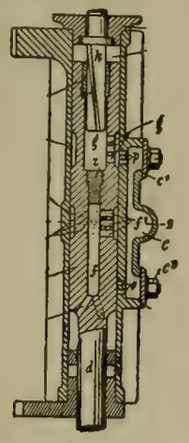
Every lode when discovered should be prospected thoroughly and its back exposed in numerous places. In this way it may be determined whether the lode in question has pay shoots, how many and where situated. Too often this precaution is neglected, and after a wearisome and unprofitable struggle the owner abandons or sells the prospect for a song, only to see later on a rich shoot of ore opened up on it by the purchaser. Lodes which, after proper surfacing, do not reveal reasonably fair values in at least one place, are seldom worth the holding by a poor man. Blind shoots may be discovered by sinking at random, but this is uncertain. Depth may show better values, but generally it does not. Even if this were known to be true in a particular case, how could a lean purse drive the drill to the required depth? Mining outside of pay shoots had better be left to him who hath and to spare.

Sumpter, Or., Dec. 6th, '99.

A Department of Mineralogy and Mining.

Representative Osborne has introduced into Congress a bill providing for the establishment of an executive Department of Mineralogy and Mining. Following is the text of the bill:

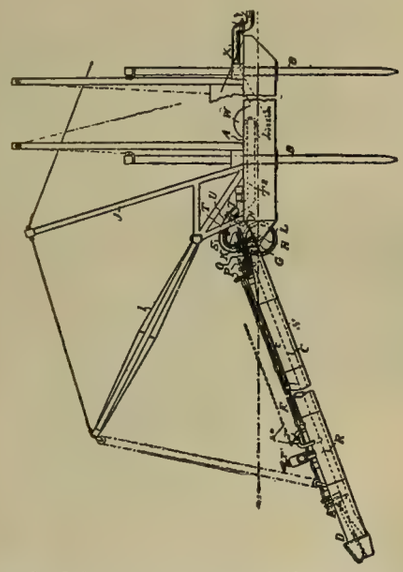
"That there shall be established at the seat of government an executive department, to be known as the Department of Mineralogy and Mining, the objects of which shall be to gather and diffuse among the people of the United States practical and useful information pertaining to mining in all its branches. Said department shall be under the supervision and control of an executive officer, to be known as the Secretary of Mineralogy and Mining. Said officer shall be appointed by the President, by and with the advice and consent of the Senate. There shall be an Assistant Secretary of Mineralogy and Mining. The Secretary of Mineralogy and Mining shall receive the same salary as is paid to the Secretaries of the executive departments of the Government. The Geological Survey, as at present established, together with all records, maps and apparatus now connected therewith, shall be transferred to and made a part of the contemplated new department. This act shall go into effect and be in force on the 4th day of March next succeeding the day of its final passage."



Representative Barham of California, chairman of Committee on Mines and Mining, is reported as favorably disposed toward the bill and will doubtless wield some influence in favor of its passage.

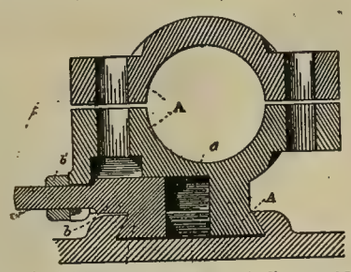
Latest Mining and Metallurgical Patents.

Patents Issued Dec. 12, 1899.



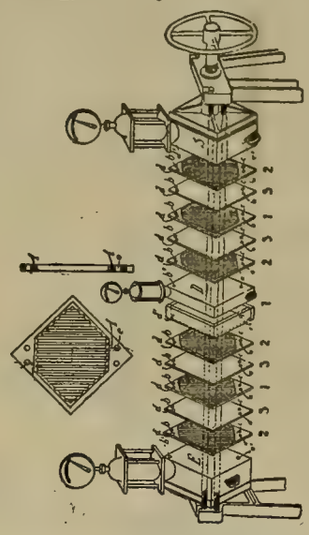
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 638,856; G. S. Ullathorne and H. P. Vacher, London, Eng.



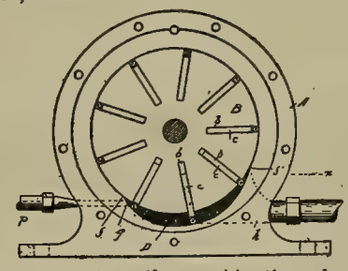
The combination of the working cylinder *a* closed on both ends by suitably shaped covers and provided with inlet ports *o* and *p* and with exhaust ports *x*, chest *c*, piston *b*, provided with annular recesses *r* and *s*, concentrical bores *f* and *g* and ports *f'* and *f²* and *g'*, piston rod *d* and of means for imparting a partly rotary reciprocating motion to the piston at each stroke.

DREDGER.—No. 638,883; R. A. Perry, Oakland, Cal.



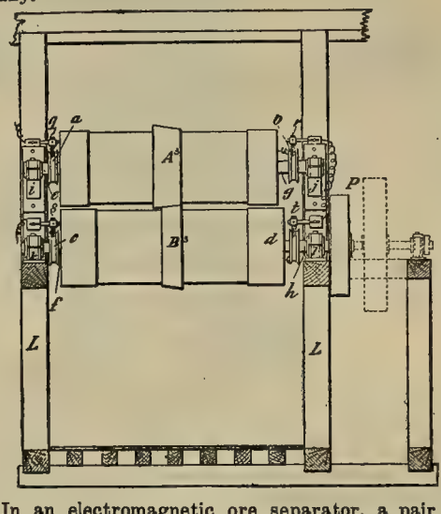
In a dredging apparatus, a stationary scow with a shaft across the front, a barrel standing at right angles with the shaft and supported thereon by a sleeve turnable upon the shaft, a ladder upon which the front portion of the suction pipe and the cutters are carried, having its rear end supported and turnable with the barrel to allow the ladder to move from side to side, and means for buoying the front of the ladder consisting of one or more air tanks whereby the scow is relieved from the weight of the ladder when the ladder is turned to either side.

ATTACHMENT FOR ROCK DRILLS.—No. 638,938; P. H. Reardon, San Francisco, Cal.



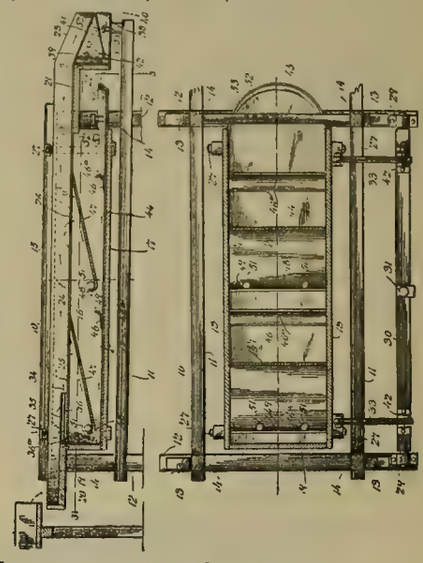
In a rock drill attachment, a shell provided with a pocket of two diameters, in combination with a column clamp having a lug adapted to enter pocket after the clamp is secured upon the column and a device opposable to the lug whereby it is secured in pocket. In a rock drill attachment, a clamp provided with means adapted to secured it upon a column, opposable projections thereon adjustable with reference to each other and to the clamp, in combination with a drill shell having a pocket of two diameters adapted to receive projections after the clamp has been secured upon its column. A rock drill column clamp having a projecting lug *A'* a device sliding in clamp and a lug *B'* similar to *A'* a suitable device adapted to engage with *A'* and *B'* whereby the drill may hang loosely thereon and means for operating the lugs whereby the drill is securely attached.

FILTER PRESS.—No. 638,949; G. Ackermann, Charlottenburg, Germany.



In a screw filter press, the combination with an inlet chamber *E*, gridiron frames, filter plates and end chamber *S*, of an intermediate or collecting chamber or chambers *D*.

WATER MOTOR.—No. 639,011; R. M. Blackmer, Wardner, Idaho.



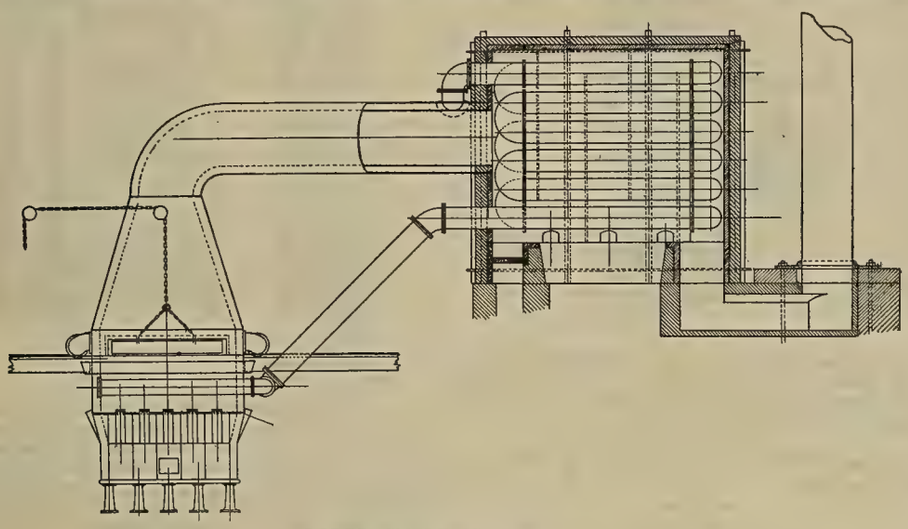
In a water motor, the combination of a casing provided with a cylindrical chamber expanded on one side, a cylindrical wheel in chamber provided with radial slots at its periphery, and plates *c* filling and adapted to slide in slots, the periphery of wheel being circular and unbroken except for slots and plates, means for keeping plates against the outer wall of chamber, a narrow water inlet at one end of expansion, so located that it shall deliver the stream of water in a direction that forms an angle with the radius of wheel at the point of delivery, slightly greater than a right angle, and an outlet for the water at the other end of expansion to that of the inlet.

ELECTROMAGNETIC APPARATUS FOR SEPARATING ORES.—No. 639,062; E. Kreuser, Mechernich, Germany.

In an electromagnetic ore separator, a pair of cylindrical electromagnets having at least three cylindrical poles of larger diameter than the intermediate parts on which the wire coils are wound, the two end poles being of the same polarity while the intermediate pole is of opposite polarity, and one of the sets of poles being made of larger diameter than the other so that such larger poles of one magnet are in contact with those of the other, while the polar distance between the smaller poles constitutes the magnetic field for the separation of the ores, and means for varying the diameters of the poles that are in contact, in order to vary the polar distance between the other poles.

ORE SEPARATOR AND AMALGAMATOR.—No. 639,089; I. A. Palmer, Seattle, Wash.

In an ore separator and amalgamator, a suspended box provided with a grizzly perforated at intervals throughout its length, a collector pan fixed to the box below the grizzly and provided with perforated riffles, a series of aprons within the box, below the perforated sections of the grizzly, and each having a perforated riffle in staggered relation to the riffles on the collector pan, a primary screen at the head of the grizzly, a tailings receptacle at the delivery end of the box and provided with an inclined apron and a riffle, and a discharge screen extending from the grizzly over the tailings receptacle. An ore separator and amalgamator comprising a shaking box provided with a grizzly, a tailings receptacle carried by box at its delivery end and having an amalgamated bottom terminating in a vertical flange, a screen inclined from the grizzly and extending over flange of the tailings receptacle to form overflow openings between the lower edge of screen and the flange, and an apron disposed within the tailings receptacle below the screen and inclined toward the head of receptacle, apron provided at its free edge with a perforated riffle.



Developed Mines vs. Prospects as an Investment.

Those seeking investment in mining property are often at a loss to know whether to buy developed mines of recognized value or to take prospects and develop them. It is a question which each one must determine for himself, and in each individual case the merits of the proposition must be carefully considered. Usually the owners of well-explored mines demand a price so excessive that the would-be investor hesitates to undertake the great risk involved, though generally the value of a mine that has extensive development may be judged with reasonable certainty beyond the amount of ore actually in sight, and if the price demanded be not too great the risk may be undertaken with a fair prospect of a successful ending of the venture. On the other hand, the great amount of money required to purchase a large developed mine will equip and explore a score or more of prospects, but the difficulty is found in selecting the right prospects. That one man can see as far into the ground as another is an aphorism, and the large number of "promising prospects" which have proven upon development dismal failures proves this. In most cases prospects, or mines with only limited development, are risky as an investment, though often most alluring. It is not always the claim which makes the richest surface showing that eventually proves the most profitable mine, and, *vice versa*, the one making a poor superficial appearance sometimes develops into a bonanza in depth. The question cannot be answered arbitrarily, as the elements entering into it are not constant. The experience of those who make a business of searching for and buying mining property in various stages of development affords little by which others may be guided along the same path, as the percentage of success or failure which each meets may generally be said to represent the extent to which each permits the element of uncertainty to enter into their investments.

The Loder Smelting Furnace.

Written for the MINING AND SCIENTIFIC PRESS.

The Loder hot blast furnace, for reducing iron, copper and nickel ores to matte, utilizes the heat units contained in the pyritic ores to produce and support a smelting fusion. By reference to the accompanying cut an idea of the general plan of the furnace will be obtained. Upper and lower water jackets are connected to maintain a uniform heat at the zone of fusion, by which the lower jackets are kept much hotter than can be done where cold water is fed to them, as by the old method. The arrangement of the bustle and tuyere pipes is claimed to possess special advantages. They are of cast iron and steel and have a deflecting nozzle. As the tuyere is pulled from the furnace the air communication is closed by a rotating sleeve, which is bored and turned to fit the bustle pipe, making a

LODER SMELTING FURNACE.

safe connection from the latter to the furnace for hot air. The air from the blower enters the hood, which forms the upper section of the furnace, at either end, passes around the hood and out through a pipe into the heating chamber, through coils, where it is further heated, thence back to the furnace through bustle and tuyere pipes. The heating chamber of a 100-ton furnace contains 2800 square feet of heating surface exposed to the waste gases of the furnace, and in which, it is claimed, a temperature of 1600° C. can be maintained without the use of carbonaceous fuel, though the patentee of this furnace recommends the use of from 1% to 5% of coke weighed in with the charge.

It is claimed that a furnace of this pattern, 34x100 inches at the zone of fusion, is of sufficient capacity to average 100 tons per twenty-four hours. The ore is oxidized and smelted by one operation. When the ore ignites one-half the sulphur is consumed and escapes through the stack as sulphurous acid fumes, while the remainder is used to supply calorific power and form a matte during the oxidation of the iron to the protoxide. The silica combines with the FeO at the zone of fusion and passes off as slag. The iron, acting with the sulphur as a carrier of values, in the form of FeS, or matte, settles to the bottom of the receptacle; the slag, being lighter, flows off at the top and is granulated and carried away in water.

The old Elgin smelter at Leadville has been remodeled by the Boston Gold & Copper Reduction Co. and is now operating as a pyritic smelter, equipped with the Loder furnace. WASCOTT.

Leadville, Colo., Dec. 9th, '99.

AN illustration is given in the *Chemical News* of the new heat process brought forward by Goldschmidt, a German investigator. A rivet, such as is employed in bridge making, is imbedded in a mixture of oxide of iron, sand and aluminum powder, and the whole plunged in sand in a wooden box; on top of the aluminum mixture, which must just emerge from the sand in the box, is placed a small lump of a mixture of aluminum powder and an easily reduced oxide, in which is fixed the end of a short piece of aluminum ribbon. The reaction is started by lighting the free end of the magnesium, more sand being immediately placed on the top of the mixture, so that as little heat as possible may be lost. If at the end of a few moments the contents of the box are emptied out, the rivet will be found to be quite red, hot and ready to be forged. Working in an analogous manner, the inventor claims, steel tubes may be welded together, at the most trifling cost, and even two bars of soft steel can be fused together. Indeed, the temperature obtained under these conditions may, it is asserted, be higher than that realized in the electric furnace.

Workings of the Home Mining Co., Leadville, Colo.

Written for the MINING AND SCIENTIFIC PRESS.

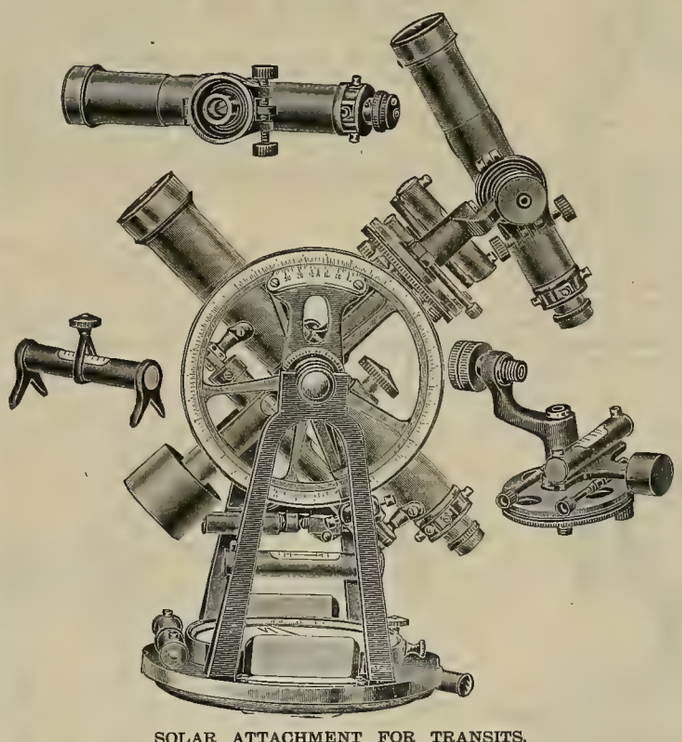
Through the courtesy of Manager Bohn and Superintendent Nimon of the Home Mining Co., the writer was privileged to see the underground workings at the Penrose and Starr shafts of the Home group. The Penrose shaft sinks 540 feet to the ore body, which lies in blanket form along the line of contact between white porphyry and dolomite. Near the base of the shaft are two pumping plants, capable of handling 1400 gallons of water per minute, and a station is being cut for a third pump. From near this point a drift is being driven northeastward to connect with the Midas workings. The original workings in the Penrose were along a level running northward, with drifts westward therefrom, narrowly missing the extensive blanket ledge lying to the eastward, which has been so thoroughly opened by the Home Co. since last August. The new work by the latter company aggregates 600 to 800 feet in drifts, crosscuts and upraises in the ore body, the work starting with a drift eastward along the southern boundary of the blanket ledge. From this drift crosscuts northward have been made about every 50 feet, and from each crosscut an upraise extends from 30 to 40 feet without reaching the upper limit of the ore body. Other drifts parallel the first, all being connected by crosscuts, which leave immense sections of ore blocked out. The parallel drifts which are being pushed eastward, are carried along in double sets and are heavily timbered as the work proceeds. The work of stoping above each drift goes on at the same time. As the work advances eastward and northward, no limit to the ore body has been found, except at the starting point along the southern edge. However, the work reveals here and there a horse or a roll of lime rock of considerable magnitude, on going through which the contact ledge is always found beyond.

The ores here found are thoroughly oxidized and consist of iron and manganese oxides carrying silver-lead values, with streaks of lead carbonates and small stringers of dioxide of manganese 50% pure. Much of the vein material is decomposed and loose in formation, interspersed with streaks of a firmer character, and often takes the form of ochre. The ore readily breaks down and is mined at light cost per ton. The net returns from the ore shipped from the Penrose has thus far reached an average of $18 per ton.

When this shaft was unwatered the levels and drifts were found completely filled with siliceous and talcy material deposited from above through the network of small water courses.

The Starr shaft, 500 feet southwesterly from the Penrose, is over 500 feet deep. It cuts the same ore body as is found in the Penrose, and on the same contact, though the porphyry here is gray, instead of white, as found on the Penrose. Then, on the Starr the ore body is irregular and faulted, appearing to roll and wave; but the product from this shaft is of very high grade. The Bon Air shaft also sinks over 500 feet, but it reaches a lower level than either the Penrose or Starr, being started from a lower elevation.

The shipments from the three shafts of the Home group amount to about 250 tons per day, though Manager Bohn states that it could readily be increased to 400 tons were there no shortage of cars for shipping to the smelters.



The accompanying illustration gives a view of the lower western slope of Carbonate hill, showing the Home group and other down-town properties.

Leadville, Dec. 7th, '99. WASCOTT.

New Solar Attachment for Transits.

The accompanying cut illustrates a new solar attachment by which surveyors' transits and mining transits may be converted into instruments by which the astronomical meridian can be determined by the sun at any hour of the day. The interchangeable auxiliary telescope, which is attached to the top or side of the mining transit, in connection with this new attachment becomes a solar telescope, as it has a greater power. The whole attachment only adds nine ounces to the weight of the transit, and is nearly balanced by the counterpoise used with the top telescope. When not required for service it may be detached from the transit and remain in the transit box.

The equatorial adapter has two parallel plates, the lower of which may be screwed to the vertical central post of the mining transit in place of its auxiliary top telescope. The upper plate, carrying the polar axis, may be adjusted to coincide with the vertical center of the transit proper, when previously accurately leveled and adjusted, by means of a small level attached to it and two leveling screws beneath the lower plate working against opposing springs. This adjustment is made by them before the instrument leaves their factory, but should occasionally be verified by the observer. About the polar axis revolves a socket controlled by a clamp and a tangent screw. The socket carries an arm to which is attached the declination axis and solar telescope in such a manner that the line of collimation of the latter revolves in the plane of the polar axis. Between the milled screw head and the arm is a milled nut so arranged that it can clamp the solar telescope at any required angle within its limit of motion. The auxiliary telescope used as a top or side telescope in their mining transits may be used as a solar telescope in connection with the equatorial adapter. For solar observations in addition to the fine vertical and horizontal cross wires adjusted to the line of collimation of the telescope is provided four coarse wires in the form of a square, equidistant from the fine wires and slightly smaller than the disk of the sun, to bisect the sun's disk by equal chords. The simplicity of this arrangement recommends it to surveyors, as the only computation necessary is that required to find the declination of the sun at the hour of observation and the proper correction for refraction. The instrument is made by C. L. Berger & Sons.

SOLAR ATTACHMENT FOR TRANSITS.

Phenomena Attending the Accumulations of Bitumen.

NUMBER III—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER, State Mineralogist of California.

Rapid percolation of siliceous waters through a rock prevents the deposition of silica. Shales and other substances containing small pores are very frequently silicated, whereas the adjoining sandstone or coarse substances are still porous. The greater porosity of the sandstones and other coarse-grained substances permit a too rapid flow of the siliceous water, and silica is not deposited; whereas since the percolation of siliceous water in the fine shale or other fine-grained substances is extremely slow silica is deposited. When these cherty shales are black it shows that bitumen was ascending with the siliceous waters at the time they were silicated. After being silicated they do not split along the plane of original deposition. Their hardness is 7. Their black color is destroyed by fire, showing that their color is due either to a bituminous or carbonaceous substance. It is in all probability the former, as carbonaceous matter does not, whereas bituminous does, accompany the flow of siliceous waters. In many places these blackened and silicated shales adjoin cracks and seams, through which mineral water accompanying bitumen is ascending.

Zaca peak owes its prominence to the protection of a crown of cherty shale; in fact, the preservation of this mountain range is owing to its silicification, which must have occurred before it rose above permanent water, whereas several thousand feet of sediments lying to the southwest of the same have been denuded in consequence of being leached and broken.

Silicated shales and sandstones are not easily eroded and suffer but slight decomposition through the action of the weather. The sandstone is not indurated to the same extent as the shale. The face of the shales are flatter than the face of the sandstones; the sandstones are nearly vertical. Frequently these cherty shales contain many small faults and cracks, the character of which show that they were made while the shale was in a semiplastic condition. They have been silicated subsequently to their faulting and cracking, clearly showing that shales were silicated after the formation had been greatly disturbed. The alteration of these white shales has been partly caused by baking, through the heat of adjacent metamorphic rocks. Joints and seams in the shales and spaces in the sandstones are colored red with the oxide of iron.

In part of the bituminized sands lenticular pieces of shale are found converted to chert, and fossil shells have been removed. These silicated lenticular pieces of shale were silicated after being water-worn, as their exteriors have all the appearances of shale. If they had been changed to chert before being water-worn, they would have had a polished surface. They show the laminæ of deposition, but do not split along the same.

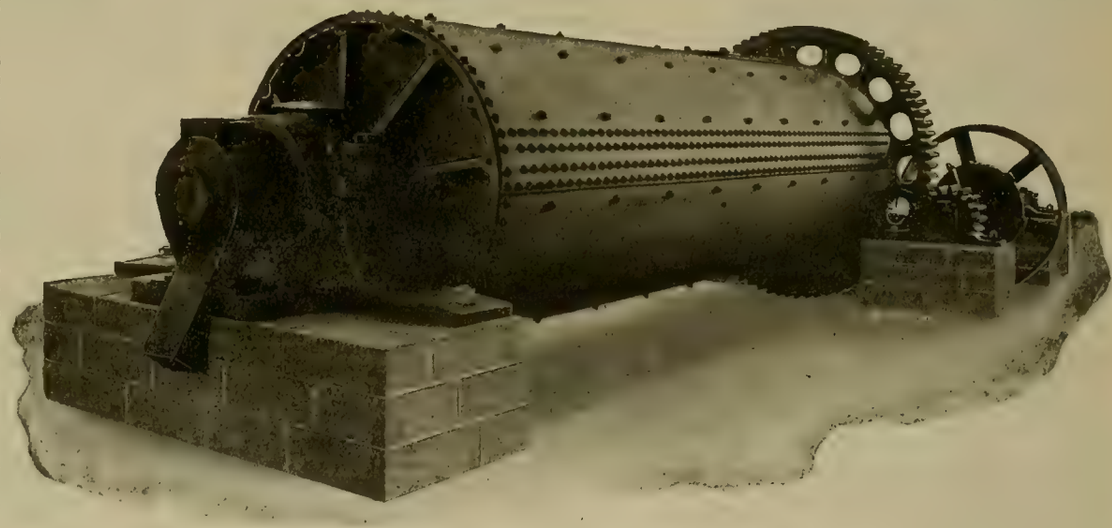
The insoluble silica in the pieces of shale consists of fine quartz sand which composed the original shale, whereas the soluble silica was deposited in the pores of the shale from infiltrating water. These fragments of shale were silicified before the interspaces of the sand were filled with bitumen, as the circulation of water ceased after the appearance of the bitumen. For the same reason fossil shells must also have been leached from the sands before they were filled with bitumen. Therefore these sands were bituminized after their deposition, and must have bituminized before they were tilted to the high angles which they now occupy, and before the metamorphic rocks came in contact with them.

The bituminized sand near Zaca creek contains at least 10,000,000 barrels of maltha. Eight barrels of ordinary petroleum is required to make one barrel of maltha. As the interspaces of the bituminous sand are filled with maltha, a space ten times as large as the present bituminous deposit was required to accommodate 80,000,000 barrels of petroleum before it was changed to maltha. The apex of the anticline lying above the metamorphic rock when the curvature of the rocks was slight must have been the storage room for this vast amount of petroleum. When the strata of this anticline containing the petroleum slowly rose above permanent water, and owing to the fact that the anticline rose to a higher altitude in the east than the west, the oil flowed down the porous strata towards the west, and during the flow was evaporated, forming maltha, which finally reached its present resting place. During this migration of the oil, besides the amount dissipated by evaporation, a vast amount must have been carried away by percolating waters or drained from the porous strata and was lost.

In 18— a multitude of fish were asphyxiated in the Pacific ocean and came ashore between Monterey and Ventura in large quantities and variety. Many were dead and others were barely alive. This was probably occasioned by the ocean waters being charged with sulphuretted hydrogen or carbonic acid. These mephitic gases emanated from metamorphic action beneath the ocean, ocean currents and migratory habits of the fish submerging them in the deadly waters. In 1899 the fish were killed in Zaca lake by sulphuretted hydrogen, the presence of sulphuretted hydrogen being evidenced by the whitish state of the water caused by the liberated sulphur. The Indians had a number of superstitions regarding this lake, which were probably occasioned by former phenomena which appeared supernatural to them.

Conclusions.—Black or dark-colored cherty shales and sandstones show that bitumen accompanied the siliceous waters while these rocks were being silicated. Light-colored cherty shales and sandstones show the absence of bitumen during their silicification. These cherty shales and sandstones indicate either that siliceous waters have cooled while ascending towards the surface, or that the circulation of the siliceous water, generally upwards through them, has been very slow. Both these flows of water would have a tendency to remove petroleum from a formation if any had existed therein. If bitumen deposits exist in a formation the leached shales and sandstones usually overlie them, although white leached shales and sandstones may exist where there is no bitumen.

A Great Torrential River.



Such is the Gogra, recently bridged at Bahram Ghat. The river has a habit of meandering at will about the country. It has moved steadily toward the east at the rate of about 600 feet per year. Floods rise 15 feet above the ordinary summer water level, and, while they last, there is great scour in the bed of the river, and, after the floods have disappeared, the main channel for 300 or 400 feet in width is about 24 feet deep, and during the hot season only about 15 feet deep. The bed and banks alike consist of sand, and the banks are, or rather were, over three miles apart. Borings 100 feet in depth have been taken at different points along the line of the bridge, and nothing but sand has been found. In the main channels of the river where the current is strong, it is believed the bed for a considerable depth must be in motion, so that a section of the river, taken in the dry season when the river is low and the currents in the channels are weak, does not represent the section where the river is in flood and the currents strong. In the building of the bridge, the Gogra and its tributary, the Chauka, have been trained into one channel, and the calculations for the discharge of the two rivers have been based on the assumption that in high flood 10 to 20 feet of the bed of the river is in motion. The other bridge over the Gogra—200 miles lower down, now under construction at Turtipur—presents correspondingly greater difficulties.—Indian Engineering.

The Mines of Ophir.

Dr. Peters, an English explorer, claims to have discovered the mines of Ophir, from which Solomon is supposed to have obtained his gold. Dr. Peters' expedition was mainly based on an old atlas published in Amsterdam in 1705 with French text, the author being unknown. In this atlas it was stated that near this place (south of the Zambesi and near the River Manzoro, now Mazoe) is the great mountain of Fura, very rich in gold, which some people regard as a corruption of the word Ophir. This view was also held by the Portuguese writer, Couto, who was quoted by Theodore Bent in his "Ruined Cities of Mashonaland." With regard to Fura, Couto said: "The richest mines of all are those of Massapa, from which the Queen of Sheba took the greater part of the gold which she went to offer to the Temple of Solomon, and it is Ophir, for the Kaffirs call it Fur and the Mons Afur." Dr. Peters states that no traveler has visited this region within the last 200 years. He has now rediscovered ancient ruins of Semitic origin, including fortifications and what he regarded as a temple or storehouse. The whole region is practically uninhabited. He also claims to have found distinct traces of ancient gold workings there.

The Clark Patent Tube Mill.

Catalogue No. 15 of the Gates Iron Works is devoted to detailed description of mining machinery, and more especially pulverizers. The Clark patent tube mill is given illustrated attention. The accompanying cut therefrom gives a general idea of its appearance, a plain cylinder of steel plate, closed at the ends by cast iron heads, having hubs or journals formed upon them, upon which the cylinder is rotated in suitable bearings. These hubs have large openings through them, lengthwise, for the purpose of feeding and discharging. Rotation is accomplished by means of a suitable gearing bolted to one head and meshing with a pinion on the countershaft by which the machine is driven. The grinding surface is obtained by filling the cylinder about one-half full of hard flint pebbles. When the machine is rotated these pebbles are in constant action against each other, and between them and the shell the material is ground; thus an extensive grinding surface, of so flexible a nature as to preclude breakage, is brought into constant action, and is renewable when the machine is in operation. The material is fed into the cylinder by a worm or screw conveyor, actuated by the rotation of the cylinder. The discharge is automatic. The outlet is housed so as to make it dust proof, the Clark patent tube mill being essentially a dustless machine.

THE CLARK PATENT TUBE MILL SHOWING DISCHARGE END.

The number of revolutions at which these mills are operated depends upon their diameters and the material to be pulverized. Usually the speed is regulated so as to give a peripheral speed of 400 feet per minute. At this moderate speed there can be no excessive wear upon the journals, which are of large size, of the ball and socket type, and so designed that the pressure per square inch upon their wearing surface is well within the limit of good practice, making an easy running bearing that will not heat, if properly lubricated. Lubrication, which is a very essential feature in all machines, is accomplished by providing large chambers for waste in the upper half or cap of the main bearing, and these chambers should be filled with wool waste, or hair felt, saturated with oil, thus providing continual lubrication.

The Gates Iron Works, 650 Elston avenue, Chicago, Ill., are the exclusive licensed manufacturers of this tube mill under patent No. 583,008, issued to J. K. Clark, May 18, 1897, and build them in the sizes required.

ONE field remains which copper is bound to maintain as its own, namely, the construction of insulated electrical conductors. Experiments have already been made on a large scale with bare conductors of aluminum for telephones with perfectly satisfactory results, its conductivity, weight for weight, being double that of copper. But when the mains have to be insulated copper is absolutely unapproachable, on account of its greater conductivity, volume for volume, which is 165% of that of aluminum.—Cassier's Magazine.

Chemical Features of Gold.

Written for the MINING AND SCIENTIFIC PRESS by GEO. A. MARRS.

Although gold is one of the best known and most talked of metals, it has many properties very little known to the world, outside of chemists, and some whose value is very little appreciated even by chemists in general. This metal is one whose chemical and physical properties are so markedly characteristic as to be readily distinguished from all others found in nature. The chief properties with which chemists have to deal are solution, precipitation, amalgamation and fusion.

Gold can be dissolved in more than eight ways. 1. By nitro-hydrochloric acid (aqua regia) with the formation of chloride of gold. 2. By free chlorine, formation of same compound. 3. By bromine which forms bromide of gold. 4. By iodine by forming iodide of gold. 5. By cyanide of potash. 6. By electrolytic action. 7. By an acid solution of ferric chloride. 8. By rare acids like those of tellurium, selenium, etc.

In the electrolytic method the gold is suspended from one pole in a solution of either cyanide of potash or common salt. The action of the electric current will dissolve the gold and deposit it on the other pole.

An acid solution of ferric chloride will dissolve gold probably as follows:

1. $3Fe_2Cl_6+2Au=2AuCl_3+6FeCl_2$.
2. $2FeCl_2+O+2HCl=Fe_2Cl_6+H_2O$.

Gold is one of the easiest metals known to precipitate from solution. When in the form of the chloride in which form it is, in the chlorination process it can be precipitated in at least eight different ways: 1. By copperas. 2. Organic matter. 3. Oxalic acid. 4. Quicksilver. 5. Lead, zinc, etc. 6. Sulphuretted hydrogen. 7. Sulphurous acid. 8. Hydrogen peroxide.

Precipitation by copperas on a commercial scale is accomplished by throwing the commercial salt into the vat, agitating thoroughly and allowing to settle forty-eight hours, when the gold will be completely precipitated and the liquid can then be drained off and the black gold mud collected and refined.

Precipitation by organic matter is certainly the cheapest and easiest method, the chief objection being the time required. Rotting twigs and branches are thrown into the solution, preferably in a wide, open vat, as the action of evaporation and sunlight materially hastens the operation. After from three days to a week, the time depending on the conditions and quantity of gold in solution, the twigs are taken out and burned and the ashes added to the gold collected from the bottom and the whole melted and purified.

Oxalic acid precipitates gold according to the following equation:

$2AuCl_3+3H_2C_2O_4=2Au+6CO_2+6HCl$.

This is the method usually employed to precipitate gold in ordinary analysis in the wet way.

Quicksilver precipitates gold as an unamalgamable brown to black powder. This precipitation is rapid and complete in concentrated solutions, but somewhat slower in more dilute ones.

Gold may also be precipitated by almost any metal, as lead, zinc, iron, copper, etc., the most satisfactory precipitant being the amalgam of mercury and sodium, especially in cyanide solutions.

Sulphuretted hydrogen, sulphides and sulphites precipitate this metal also, but they are used mainly in the laboratory alone.

The most peculiar method of precipitating gold is by the addition of hydrogen peroxide. This compound is one of the most powerful oxidizing agents known and yet in precipitating gold it has the effect of a strong reducer. This action comes about thus—because the extra atom of oxygen in the peroxide of hydrogen needs another atom to unite with it, before it can pass off as free oxygen, i. e., only two atoms at a time can escape, and so when the hydrogen can be abstracted, the two atoms of oxygen unite and are freed, leaving the hydrogen to reduce the gold. The equation is:

$2AuCl_3+3H_2O_2=6HCl+2Au+3O_2$.

Probably the most interesting and at the same time the most valuable property of gold from a mining standpoint is that gold forms an amalgam with quicksilver. By far the larger part of the gold in use to-day is derived from placer mining and the stamp mill; and as a natural consequence the assayer is constantly called upon to make amalgamation tests. The methods used by different assayers in this determination are quite varied, but the usual practice is to assay the ore before and after amalgamation, when the difference is then supposed to represent the amount of gold amalgamated. This method, as will be seen later, is not only far from accurate in most cases, but in some cases is very inaccurate. Let us suppose an assayer is given some placer sand which averages $2 per ton to make an amalgamation test. Let us suppose it is flake gold containing flakes which weigh from $\frac{2}{10}$ milligram down (which is the usual case). Say he takes 10 lbs. of the sand, crushes, assays and amalgamates it in the usual way. Now to assay $2 per ton this will contain 16 5 milligrams of gold. Suppose that it contains ten flakes of $\frac{2}{10}$ mg. gold, twenty flakes of $\frac{1}{10}$ mg., and 12 5 mg. of finer gold. He takes out one assay ton to assay and gets one $\frac{1}{10}$ mg. flake and $\frac{2}{100}$ mg. of the finer gold, which makes his assay $\frac{12}{100}$ mg. or about $2 40 per ton. After amalgamation we will say he has left two flakes of $\frac{2}{10}$ mg. gold, five flakes of $\frac{1}{10}$ mg., and 4 1 mg. of finer gold, making a total of 5 mg., and consequent amalgamation of 69 7%. Now in his last assay if he got only finer gold the sand would assay 50 cents per ton or amalgamation would be 79%. If he got a $\frac{1}{10}$ mg. flake, which is highly probable, the sand would assay about $2 25 or amalgamation of 6¼%. If he caught one of the $\frac{2}{10}$ mg. flakes the sand would then assay $4 25 and the assayer would have his test to do over on a better basis.

This may seem a little overdrawn but it has been determined by actual experiment that it usually happens that more markedly discordant results than these are obtained. For example, some placer sand showed by fire assay $2 per ton. One sample for amalgamation showed 60% extraction, another 20%. The ore was reassayed and showed $1 per ton and 90% extraction. Later it was found that the correct assay was 75 cents per ton and about 5% extraction by amalgamation, the difference in assays being due to irregular distribution of the gold in the sand.

The following scheme will give more accurate results: Ten pounds of ore, crushed if necessary, is panned down with one ounce of quicksilver in the usual way. The mercury is then collected, washed and evaporated until only a small globule of mercury (say one gram) remains. It is then cooled and put into a test tube and the quicksilver dissolved off in c. p. nitric acid. The gold will remain in a good form for weighing and will be free from silver, which will remove the necessity for inquartation and subsequent parting. The yellow globule of gold is washed, the test tube filled with water and inverted over a porcelain capsule. The gold immediately falls to the bottom, when the test tube is withdrawn, the water drained off and the gold annealed and weighed on an analytical balance (an assay balance is unnecessary). Let W be the weight of the gold in grams, and let X be the gold extracted per ton: then 10:2000 :: W:X. X will be in grams and can then be transferred into troy ounces, if so desired. If the percentage of extraction is wished, four crucibles of one-half assay ton each can be run instead of two, on the original assay, but even in this way the results are liable to be very inaccurate.

There are several simple tests for gold in small quantities which if more widely known would save many a prospector both time and money. One very good test is to pulverize the ore fine and cover one-quarter teacup of it with about a quarter of an inch of a dilute solution of bromine in water, and let stand several hours. Then draw off as much of the liquid as possible without disturbing the sediment. Add stannous (tin) chloride and agitate briskly. If as much as $2 per ton of gold is present a light pink or purple color will be seen.

If greater accuracy than this is desired do not add stannous chloride, but throw a filter paper into the solution and evaporate to dryness; an ordinary saucer is a handy vessel for this operation. Now burn the filter paper to an ash in a porcelain capsule. If 50 cents of gold per ton is present it ought to color the ash a purple tint.

A good test for the presence of free gold is as follows: Some of the rock is ground fine in a mortar; quicksilver is added with a little water and the ore ground again; now add concentrated sulphuric acid and grind again; finally add water and grind the fourth time. Wash off the acid and collect the quicksilver by adding a little concentrated nitric acid and panning. Either dissolve the mercury in nitric acid or evaporate, when the gold will be left if present in any noticeable quantity.

Golden, Colo., Dec. 10th, '99.

Powder Used in Coal Mining.

An interesting detail in coal mining operations in Nova Scotia is the consumption of blasting powder. Nine of the Cape Breton collieries during the year ended Sept. 30th, '98, produced 1,413,701 tons of coal, requiring the use of 229,414 pounds of powder, or equal to nearly one-seventh of a pound, roughly speaking, for each ton mined. The above quantity of powder, at an average cost of, say, 12 cents per pound, amounts to over $27,000. The bulk of the explosives used in these operations is produced in Nova Scotia.—American Manufacturer.

IT has been reported that the smelters of Colorado will pay but $19 per ounce for gold contained in ores. Should this be attempted it is needless to say that the innovation will be vigorously resisted by the miners of that State.

Cum Grano Salis.

John W. Gates told a party of friends how he happened to get back into active business after he had cleared up a big fortune from the sale of his Federal steel and other interests and had made up his mind to retire. The story was not told in a boasting spirit, but the recital was nevertheless one of live interest as illustrating the whirlwind methods employed in organizing a gigantic enterprise and getting it under way.

Mr. Gates and Colonel Elwood had realized a "bunch of millions" out of Federal steel, and the former had laid his plans for a trip around the world with his wife, having gone so far as to invite a party of friends to accompany them and fix the date of departure. One day while sitting in his office in Chicago chatting with Colonel Elwood he was called up on the long-distance telephone by an acquaintance in Pittsburg, advising him that the owners of a big wire milling company had fallen out among themselves and would sell. "If you want to make a trade bring on $1,000,000 and I think you can get the property," said the man at the other end of the wire. Inasmuch as the mills were worth at least $2,000,000 the temptation was strong to buy them. The two millionaires who had just laid down business cares concluded to take the property "for a flyer."

The next evening they were in Pittsburg, and snugly reposing in Mr. Gates' cardcase was a certified check for $1,000,000. They had an all-night session with the owners of the wire mills, and at 5 o'clock in the morning they had the property and the former stockholders carried off the big check. The party repaired to the Duquesne Club for refreshments. There they met the proprietor of a big wire mill up the State, and to him the story of the night was told

"If you fellows have money to burn you'd better buy my mills," he said, banteringly.

"What will you take for them?" responded Mr. Gates.

"Nine hundred thousand dollars," was the answer.

"It's a go," said Mr. Gates, quick as lightning, and a deal involving nearly $1,000,000 was closed in less than sixty seconds.

The two Chicago men then communed briefly, and Colonel Elwood remarked: "John, if we are going into the wire business we must have a base of supplies. Better see if we can't buy the Cleveland Rolling Mills."

Taking the first train out of Pittsburg, they proceeded as fast as steam could take them to the city on the lake. That evening they broke in on the owner with the blunt statement that they had come to buy his property, which included rolling mills, steamships, docks, iron and coal mines, etc.

"But I don't want to sell," he protested. "Still," he said, hesitatingly, "I would like to hear your proposition. What are you prepared to offer?"

"Five million dollars cash," was the reply. And then Mr. Gates added: "Five million dollars is a big bunch of money. Better think it over."

"I want more money," expostulated the Cleveland man.

"We will give you $5,000,000 and not a dollar more."

The gentlemen met later in the evening and before midnight the trade was closed, the old owners stepping out and the new stepping in. The "cleaning up" yielded $2,450,000 in cash, so that the property really cost Gates and Elwood $2,550,000. It was worth from $7,000,000 to $8,000,000 without the cash. The next morning the Cincinnati *Enquirer* had the story of the Pittsburg deal, and the telegraph brought an offer of some valuable wire plants in and near the city. Mr. Gates repaired at once to Cincinnati, and Colonel Elwood hastened East to negotiate for valuable plants in Massachusetts. Forty-eight hours later they met in New York and on comparing notes found they had invested $12,000,000 of their cash in wire plants. All that happened during the week between Christmas and New Year, less than a year ago.

"It looks as though we were in the business," said Mr. Gates.

"A fair nucleus," responded Colonel Elwood. "Let us go home."

They cannon-balled to Chicago, and in less than another week arrangements were practically consummated for the giant consolidation known as the American Steel & Wire—capital, $90,000,000. January 18, or a little over three weeks from the date of that long-distance telephone conversation between Chicago and Pittsburg, the constituent properties were duly turned in, and the S. & W. stock was distributed according to arrangement.

This, in brief, the Chicago *Post* says, is the inside history of one of the "lightningest" deals for its magnitude ever negotiated. It was a Napoleonic campaign from start to finish. It is not recorded that either Mr. Gates or Colonel Elwood lost money on the transaction. Mr. Gates called off that trip around the world.

THERE are at present no less than half a dozen "petrified men" on exhibition in various portions of the United States. They have all come to light within the past year. They were each probably cast in the same mold.

Mining Summary.

ALASKA.

The report of the Alaska-Mexican mine for the past fiscal month shows 14,024 tons ore crushed, yielding $16,036, and 222 tons sulphurets saved, worth $6088. Gross yield, $28,791; average of ore, $1 69 per ton. The working expenses were $18,928.

The Alaska United mine reports 21,304 tons ore crushed, valued at $37,593, and 475 tons sulphurets saved of a value of $18,353. Gross yield, $54,615, and working expenses, $37,840. The ore averaged $2 50 per ton.

The discovery of a large gold-bearing mineral zone on the Yukon river, seven miles from Dawson, is reported. A large number of claims have been taken up.

ARIZONA.

COCHISE COUNTY.

The Dos Cabezas Con. Copper Co. has been organized with $2,000,000, and has bought the Emersly group of thirty copper claims at Dos Cabezas, near Wilcox. J. Schwertner of Wilcox is Supt. A smelting plant is to be put in.

MOJAVE COUNTY.

The Tennessee mine at Chloride has 1000 feet of development and is working three shifts. The ore carries 20% lead, twenty ounces silver and $4 gold per ton. One hundred tons of ore are treated daily.

E Roberts and J. H Carpenter report finding rich silver ore at White Hills on an extension of the Grand Army mine. A 10-stamp mill on the Grand Army mine is to be moved to the Gold mine in Cook district, on the opposite side of the valley.

Kingman *Mineral Wealth*: The Aubrey and Cedar mining districts in the southeastern part of Mojave county are attracting attention. The San Francisco mine in Cedar district is reported to have a rich body of ore and will soon have their stamp mill in operation. Work on the Midas M. & M. Co.'s properties is being pushed.

GRAHAM COUNTY.

The Azurite mine is reported sold by Shirley Christy for $500,000.

YAVAPAI COUNTY.

By a recent deal the Rebel mine, south extension of the McCabe mine, passes to H. B. Clifford. The McCabe vein is large and heavily mineralized and is one of the best paying mines in Arizona. The normal ore is sulphide, principally iron, and is rich in gold, while copper and silver occur as by-products. It is stated that the average of the ores is $60 per ton, while a great deal of the shipping ore runs higher. The deepest workings are now 557 feet, with one of the largest and richest bodies of ore yet encountered in the mine at the bottom. Judge Wells of Prescott owns the largest part of the property. There are two veins in the McCabe property, 500 feet apart. The most westerly one is a fissure about 4 feet wide, in which the country rock has been reduced to clay by pressure and movement. Within this the pay shoot occurs of variable width. In the early history of the mine it produced a large amount of shipping ore, some of which went $1700 per ton. This claim was called the Sink to Rise. The other vein is on the Gladstone claim and is parallel with the first, but in some respects differs, as the vein is represented by a zone of shearing of variable width, along which the ore occurs, having little barren vein filling such as is found in the neighboring vein.

T. E Peery has sold his mines near Stanton to the Octave M. Co. for $30,000.

Mr. McDonald, who has charge at the Buster copper properties, near the Peck, is crosscutting to the vein, which shows a number of small, rich stringers.

Prescott *Courier*: The old Tiger mill, operated by G. P. Harrington, started up December 10. The old silver pan mill has been changed to a modern gold plate mill. A test run of 100 tons of ore from one of O. Sibardou's properties is being made.

CALIFORNIA.

Amador.

A station is being cut on the 1200 level of the Lincoln. A compressor is being put in, the foundation being completed, and when the west crosscut is begun power drills will be used.

The Mason & Greisbach mine, at Pioneer, after a year's work, is again in condition to take out ore. The last tunnel completed gives an additional 100 feet more backs than the old tunnel.

Dr. Adams and partners are still taking gold from the Mt. Echo property, near Ione, and J. Newman and associates are developing an adjoining claim.

Three levels of the Ranlett copper mine are being worked, and when the requisite number of tons of ore have been brought to the surface the smelter will be blown in.

Sutter Creek *Record*: The Potazuba M. Co. have suspended operations until spring, when they will equip the mine with heavier machinery and sink the shaft to 1000 feet. It was deemed impracticable to keep the water out of the shaft and sink it deeper during the winter. The company has expended $50,000, of which $15,000 was taken from the mine. Several levels have been opened, showing large bodies of low-grade ore and small veins of high-grade ore. It is thought that with the shaft down 1000 feet and new levels opened up the developments will justify a mill.——Sinking is in progress at the south shaft of the Gover, north of Amador City.

Calaveras.

A Boston dispatch says the stockholders of the Melones M. Co. held a meeting in that city Dec. 14th, at which the old board of directors and officers were re-elected. It was decided to issue preferred stock to raise the money necessary to continue development work at the mine, construct the dam, build and equip a mill, etc. Details will be determined by the future meeting of the finance committee.

The report of Gen. Mgr. W. C. Ralston to the second annual meeting of the stockholders of the Melones M. Co. shows that 2129 feet of openings have been made during the year, making a total of 6759 feet of openings in all. Ore in sight is estimated at 1,000,000 tons. Forty-nine tons of ore taken from an upraise for a distance of 339 feet returned at the mill $3 73 per ton. Of the $300,000 originally constituting the treasury fund about $280,000 has been spent. Mr. Ralston says it is conservative to estimate that all of the ore in sight will net the company at the mill a profit of at least $1 per ton.

The mines at Copperopolis have been unwatered to the fifth level.

On the afternoon of the 20th inst. a cave occurred in a stope on the 300 level of the Lightner mine at Angels, imprisoning four miners, one of whom has since been rescued.

At the Ellen Vannen gravel mine in Old Woman's gulch fifteen men are taking out fifty tons of gravel per day. The width of channel is unknown.

Half a mile north of the Ellen Vannen the Empire tunnel is being driven to drain the mammoth gravel channel which extends from a mile east of Mokelumne Hill down the entire length of Old Woman's gulch. This property is owned by the North Star Con. M. Co., P. L. Shuman Mgr. The tunnel is 10 feet wide at the bottom, 8 feet at the top and 7½ feet in height. The tunnel is in bedrock and will tap the channel at about 1100 feet from its mouth.

Three shifts are working at the Hexter tunnel, owned by C. W. Howard of San Francisco. The tunnel is in bedrock and is intended to tap the Corral Flat gravel channel, which passes under Stockton ridge. Wm. Jones is Supt. Machine drills are used and the tunnel is in 1400 feet.

The Kramer gravel mine on Golden Gate ridge, recently bought by an Eastern syndicate, will be cleaned out and retimbered, steel rails will be put down, and new air pipes installed, and as soon as the mine is in condition a 10-stamp mill will be erected. J. K. Carpenter, formerly of the North Star mine, is Supt.

S. S. Moser, who owns the property adjoining the Lamphear, in Spring gulch, is getting out rock and running it through the Lamphear mill.

The shaft on the Demarest mine, south of San Andreas, is to be sunk 200 feet deeper. New machinery is being put in. This mine made a good record thirty years ago, but until two years ago had remained idle for a quarter of a century.

El Dorado.

(Special Correspondence).—The Oro Fino, or Big Canyon mine, is running thirty stamps upon ore of satisfactory grade.

The Union mine is running twenty stamps during the day time on high-grade ore. It is currently reported they are taking out upwards of $20,000 per month.

The Vandalia mine is cyaniding thirty tons per day, which is giving satisfactory results. The owners, Seamour & Saver, are now figuring to increase their plant to 100 tons capacity per day. They have sufficient good ore developed to keep them going for many years.

The St. Claire mine, near Kelsey, cleaned up last week from 105 tons of ore a little over $1100. They have a good-sized vein and plenty of the same quality of ore in sight.

The Blue Gouge mine, twenty miles east of Placerville, is now constructing a 20-stamp mill and four Huntington mills at their property. They have a large amount of low-grade ore. The ore-bearing zone is said to be 700 feet wide.

The old Van mine, near Georgetown, has been unwatered by Lane & Smart and found to be satisfactory; they are now preparing for more permanent work.

The Little Gem mine, at Volcanoville, owned by Judge Behars of San Francisco, is building a mill at the mine, which is nearly completed.

The Poverty Point 15-stamp mill is run steadily by leasers and the ore is turning out satisfactorily to all concerned.

The Cambrian mine, six miles west of Placerville, owned by Colorado people, is running ten stamps on high-grade ore. It is said they came on to a large body of rich ore last week.

Chapman & Parker are now building a gravel mill 1½ miles east of town. It is said they have good prospects

The Kimble & Cohn gravel mine is working a number of men and the mill is running on the cement gravel.

Placerville, Dec. 18th, '99.

Humboldt.

Blue Lake *Advocate*: With the location of two more 160-acre claims last Saturday the new oil locations in the Mattole oil fields now aggregate 12,420 acres.

Kern.

Since its incorporation, Dec. 1, 1897, the Yellow Aster Mining Co. at Randsburg has paid $280,000 in dividends, having previously paid $33,789. It has also built a 30-stamp mill, equipped the mine with hoisting machinery, and made many other costly improvements. The point of discovery, an outcropping ledge of pay rock, has not been disturbed and may be seen by the passer by. The first dividend paid was $100, which was divided equally among the three partners. Two hundred men are now employed, the payroll reaching $15,000 monthly. An addition to the mill is in contemplation. The capacity of the mill is 140 tons daily, which requires 140,000 gallons of water, pumped from the wells six miles distant. It is stated that the ore amalgamates so freely that tailings are worth less than $2 per ton, and that concentration does not pay on oxidized ores.

Randsburg *Miner*: The Buckboard mine is milling 300 tons at Barstow. The ore runs $20 per ton.

The California Borax Co. has bought the Gordon brothers' mine and mill in the Slate range for $15,000. They will add eight stamps, making it a 10-stamp mill.

The Spangler brothers have struck a 3-foot vein of ore in a tunnel in one of their mines, seven miles from Garden station, 9 inches of this going $100 per ton, the balance $50. It is not all free milling, but the concentrates can be shipped. They are operating an arrasta successfully at their mine, hauling the water from Garden Station.

The Pinmore will be worked through a shaft when the mill starts, instead of through the tunnel, as formerly. Part of the mill is on the ground, and the work of erecting it is in progress.

Los Angeles.

The Anker Metallurgical & Furnace Co. has its new smelter at Los Angeles ready to handle ore. The company is incorporated for $500,000. A smelter was projected here some years since by the late Dr. Endleich, but never materialized. Several years ago a small smelter was built and run for a time at Oro Grande, in San Bernardino county, which was destroyed by fire, and thirty years ago a smelter was run at the Resting Springs mines for a time. These three smelters are the only ones ever built in southern California.

Mariposa.

A strike of rich ore is reported north of the Mary Harrison shaft, two miles south of Coulterville. The quartz at this mine occurs in the dolomite vein, and is associated with black clay slates, serpentine and diabase. The quartz varies in width and also in value, but is generally of medium grade. Visible gold often occurs upon the cracks appearing in the quartz. It was worked to a depth of 600 feet years ago. The Merced G. M. Co. has reopened this mine and several others on the property formerly called the Cook Estate.

Nevada.

The pumping machinery at the Bullion mine, near Grass Valley, is run by an electric motor recently installed by G. S. Mainhart, superintendent.

The Nevada City mine in Woods Ravine has passed conditionally to the principal stockholders of the Champion Co. For years the Nevada City mine has been in litigation. The mine was worked and an indebtedness of $20,000 created against the property. Suit for possession followed, and recently Judge Morrow rendered a decision in favor of the lien holders of the property. Plaintiffs have appealed the case to the United States Court of Appeals. The purchase is conditional on the lien holders being decreed the rightful owners.

Placer.

Work has been resumed at the Gold Blossom, near Ophir. It has a 20-stamp mill.

The new air compressor and drills at the Boulder mine, near Ophir, are running, twenty men being employed.

Gilbert & Colwell are preparing to hydraulic the Ben Franklin gravel mine, near Colfax.

Pond Bros. will hydraulic at their claim in Todds valley, and deposit tailings behind a dam in Todds valley canyon.

The mill at Pioneer mine, near Damascus, is running on half time. An upraise is being made from No. 4 to No. 3 level. J. J. Sullivan is superintendent.

One of the compressors at the Drummond mine, near Forest Hill, will be taken to Ophir for use at the Gold Blossom mine.

Colfax *Sentinel*: At the Clark mine, at Yankee Jims, an incline is running 500 feet from the mouth of the tunnel to reach the bottom of the channel.——The Southern Cross quartz mine, at Euchre Bar, on the North Fork of the American river, near Towle, is being opened up from the west tunnel. The ledge was struck at 170 feet. The tunnel was driven along the hanging wall. The quartz is heavily charged with arsenical pyrites. The tunnel will be continued 100 feet more on the vein, when a crosscut will be run to cut the east and middle veins. An 857-foot tramway is being laid.——The mill at the Rawhide mine is crushing ore steadily. This mine is owned by J. T. Patrick, and is on Texas ridge, five miles south of Blue Canyon. The main tunnel is in over 100 feet and a lower tunnel has been started. The ledge is 2 to 5 feet in width.

San Bernardino.

A smelter at the Needles is being talked of again. A few years ago a milling plant was built near Needles, but the "process" was not adapted to the ore of that region, nor to that of any other, and soon failed.

J. B. Anderson is about to resume work on his claims near Kleinfeldter, half way between Needles and Blake stations.

There is a group of claims containing gold and copper in the Exchequer district, north of Homer station, on which considerable development has been done, but little of late. The ores are of good grade, but the faults and dykes which have dislocated the veins have proven a serious drawback to miners of limited capital. There is also a scarcity of water, which further embarrasses the advancement of an otherwise promising district.

The Peacock Copper M. Co. are shipping high-grade copper-silver ore from their mine in the Lava Beds district. This ore—bornite and chalcopyrite—runs from 20% to 30% copper and fifteen ounces silver per ton. The ore occurs in quartz porphyry. There is scarcely a sign of copper on the surface. A hundred yards from the main outcrop is seen the films of malachite incrusting the seams in the rocks, but constituting a small fraction of 1% in copper. The mine was originally opened on the outcrop of silicious silver ore, honeycombed and mineral stained from weathering. The first copper ore was discovered by accident in a crosscut tunnel run to develop the shoot of silver ore.

San Diego.

Thos. Johnson of the American Girl mine, four miles south of Hedges, says the camp is flourishing and a large crew is working on ore running from $15 to $20 to the ton. The American Girl property is in many respects similar to the Golden Cross mines at Hedges, though said to carry a higher grade of ore.

Santa Clara.

It is reported that the New Almaden, as well as the Guadaloupe mines, ten miles from San Jose, are involved in a transfer to English owners. The Guadaloupe is to be rehabilitated and supplied with modern machinery, furnaces, etc. The mine has been idle over twenty years.

Shasta.

(Special Correspondence).—The Bennington group of mines, comprising ten claims, located near the Iron Mountain mine, were sold this week to O. E. Williams and C. F. Bunker for $25,000; work began continuing two tunnels and shipping ores to the Keswick smelter. The property is contiguous to the Mountain Copper Co.'s railroad. The sale was made through the Pacific M. & D. Co. of Redding. The ore bodies average 2½ feet in width and the values run from $7 to $51 a ton.

The Black Spider mine, near Keswick, which has been idle for six months owing to the inability of the owner to cope with the influx of water, has been bonded to San Francisco capitalists. Engine and hoist are being placed and unwatering the mine will begin next week under the supervision of G. E. Bateman. Miss R. A. Bell of Shasta owns the property. The negotiations for the transfer of the property to the new company were made by the Redding Pacific M & D. Co.

Local report says that F. H. Dakin has sold to Wheeler & Speier of New York a section of land near Kennett, ostensibly for a smelter site,

Redding, Dec. 20th, '99.

In the new shaft of the Midas mine, on Harrison gulch, at a depth of 80 feet, a new ledge has been cut. A 20-stamp mill is building.

The Mount Shasta mine has closed down temporarily pending the placing of an electric hoist. The shaft is down 300 feet, and was sunk to that point by use of a gasoline hoist.

Siskiyou.

The Greenhorn Blue Gravel Mining Co. is contemplating sinking a new shaft, having a large amount of channel unworked.

At the Sheba mine on Patterson creek the air compressor is in position and power drills are to be used hereafter in the mine.

COLORADO.

CLEAR CREEK COUNTY.

(Special Correspondence).—The Wilkie mill, with its water power rights, has been purchased by W. E. Renshaw, whose purpose is to convert it into an electric power plant, to supply power to run the Newton, Silver Age and other mills. The erection of a new mill is planned by Mr. Renshaw to take the Gem ores.

The Atlantic & Pacific Railway tunnel, located about ten years ago by M. M. Pomeroy, contemplated cutting through the Continental Divide at a point near Gray's Peak, forty miles west of Denver. The tunnel starts on the eastern slope, about six miles from Silver Plume, at an altitude of about 9300 feet, and takes a westerly course. In '90 to '92 it was driven about 4000 feet, and to complete it to the proposed exit on the opposite side of the range would make nearly five miles of tunnel. This was part of a still bigger scheme to build a railroad directly from Denver to reach the undeveloped country in western Colorado and eastern Utah and to shorten the railway distance between Denver and Salt Lake City. While this auspicious dream of ten years ago did not materialize far beyond the issuance of flaming prospecti and the sale of shares of stock, it is now recognized that the central idea behind it was one of merit, of which the present generation may yet see a tangible fruition. The development of Denver as the leading mining and supply center of the Rocky mountain region must include the reaching of those new western fields by direct lines of travel. An awakening to facts bearing upon this subject has revived interest in the old tunnel proposition referred to.

Denver, Dec. 16th, '99. WASCOTT.

The owners of the Standard claims on Fall river have cut a fourth vein in the tunnel and have a wide body of ore. It was showing nothing until they put some shots into the hanging wall, when several feet of mineral was exposed. This is being drifted on.

The Tropic shaft, belonging to Jay Morton, has been retimbered and ladders put in to a depth of 300 feet for the purpose of a survey to arrive at the pitch and course of the vein. If it is determined that the vein cut by the Newhouse tunnel is the Tropic, work on it will commence within thirty days. The vein will be worked through the tunnel within thirty days after the first of the year.

CUSTER COUNTY.

The S. A. K. copper lode in Verde district has been sold to Eastern parties, the owner, J. Wilson, retaining an interest. Mr. Wilson has been twenty years developing this claim single-handed.

The Pointer has a body of ore in the west drift that assays half an ounce in gold and 515 ounces silver to the ton.

GILPIN COUNTY.

(Special Correspondence).—J. F. Depew is in charge of the Hillhouse mine, under lease and bond to C. A. Rice and associates. The hoisting machinery is being overhauled, preparatory to resuming work.

It is claimed the Argosy is to be equipped with new machinery and new buildings. Chris Hesselbine is in charge.

A pump of large capacity has been set at the 800 level of the Cook mine to handle the water which comes from a recently opened

crevice. When the connection shall be made with the Gregory-Bobtail workings, however, the water will be handled by the pumps at the foot of the incline.

The Crown Point and Virginia has installed a pump at the 580-foot level, to work in conjunction with one already in use.

The shaft at the Concrete mine is at a depth of 1300 feet and sinking is to continue. New hoisting machinery is to be provided.

The Boston & Denver Co. are driving a tunnel through Bates hill, having already advanced about 500 feet. It is designed as an ore haulage route from the Cook mine to the new mill of the Boston & Denver Co.

Blackhawk, Dec. 18th, '99.

GUNNISON COUNTY.

Denver *Republican*: The Wanderer's Last Chance group of four claims in Tin Cup district has opened a body of sulphide ore that will average $100 per ton. The shaft is down 117 feet and a tunnel is being driven to cut the vein lower down. Several shipments have been made.

The Midland mine, in the Gold Brick district, is to be started up with twenty men.

LAKE COUNTY.

(Special Correspondence).—Stevens Bros., having a lease on the Kitchen shaft of the Star group, are shipping twenty tons of manganese ore per day to the Illinois Steel Works. This shaft, 275 feet deep, was sunk twenty years ago from the kitchen of an old-time boarding house—hence its name.

The Catalpa-Crescent lease, on Carbonate hill, in the hands of Geo. W. Arthur and others, ships about eighty tons of oxidized iron-silver ore per day, including some manganese and lead. The shaft here is 480 feet deep, from the base of which the work extends several hundred feet east and west. The Colorado Southern belt line now extends over this part of the hill.

The Yankee Doodle, south of the Catalpa, is leased to Gordon & Thompson, who are drifting from the 450-foot shaft, expecting to strike the ore body, which pitches toward them from a point farther west. They expect to be shipping within thirty days.

The Modoc, some distance south of Yankee Doodle, has put in a new boiler and hoist and is about ready to resume operations from the 800-foot shaft. Dr. Hearne of Leadville is Mgr.

The Fortune and Penfield, on Little Ellen hill, were recently sold to New York parties for $100,000. The sellers were F. Brooks, Major Wilder, S. W. Southwick and others, and the negotiations were carried through by L. C. Ferree of Denver. The group is in the neighborhood of the Resurrection, Sedalia, Dollie B. and others. The property is fairly developed, disclosing a body of carbonate ore, carrying lead, gold and silver values.

Various projects to provide water pressure for the generation of electric power for the Leadville mines appear to be receiving serious consideration. Just now a shortage of coal supply for steam use is believed to be a possibility, due to the inability of coal operators to supply the unprecedented demand, the latter claiming that the unusual activity in metal mining has drawn large numbers of coal miners away from them, leaving them short of the usual force. The idea is that, with sufficient generative force, the several hundred hoists, pumps and compressors in the district could be operated by electric power at much lighter expense than by steam and would render the operators more independent of fuel combinations. It is claimed the required volume and pressure of water can be developed on the western side of the Arkansas valley and also on Ten-mile creek, east of the Mosquito range. In these days of long-distance transmission the problem of securing adequate electric power for Leadville district would seem to be merely a question of interesting the necessary capital in the proposition. WASCOTT.

Leadville, Dec. 12th, '99.

The zinc producing mines of Leadville are showing unusual activity. The concentration plants of the Antioch and Moyer mills are treating this class of ore and shipping the results of concentration daily. There are large amounts of tailings and old dumps, besides ore standing in the mines in sight in which the principal values are in the zinc contents, and it is this material that is now being treated. The greater product is being shipped to Europe through New York houses.

Leadville mines are shipping zinc ores to Antwerp, Belgium.

The recent rise in the price of lead has given an additional stimulus to mine operation and development in Leadville. Most of the prominent lead producers are in condition to take advantage of the market and the output will be materially increased in consequence, if sufficient cars can be obtained to handle the output.

PARK COUNTY.

(Special Correspondence).—T. R. Miller and Nathan Gregg have organized the Platte River Gold Dredging Co., to inaugurate dredging operations near Fairplay and Alma. It is claimed they have secured 2600 acres of auriferous ground in this vicinity.

Alma, Colo., Dec. 18th, '99.

RIO GRANDE COUNTY.

(Special Correspondence). — The Bobtail mine is one of a group to be operated through the Golconda tunnel, almost completed. A shipment of two cars of rich ore was made from the Bobtail on the 8th inst. The other mines in the group are the Aztec, Golconda, Little Annie and Iowa, all in the group being on the same vein. These properties are at the old camp of Summitville and have been worked for several years.

Summitville, Dec. 16th, '99.

TELLER COUNTY.

(Special Correspondence). — The Isabella directors declared a dividend of 3 cents per share, payable Dec. 16th, which amounted to $67,500, leaving a cash reserve of $171,000 in the treasury. A shipment of ten tons of ore was made from this property on the 12th inst. which was valued at $10 per pound.

A party of twenty-two Detroit, Mich., men, who are interested financially in the Detroit Reduction Works at Independence, Cripple Creek district, visited the place last week to inspect the mill, mention of which was made in these columns some time ago.

A recent strike of rich ore on the sixth level of the Elkton is reported. The new lead is said to be 6 feet wide. The Elkton has shipped 1000 tons per month for the last quarter. The Elkton Co. recently acquired the Thompson mine, which adjoins them on the south. The main workings will be extended into this property.

Horan & Co. shipped sixty tons of ore from the Deadwood on Battle mountain, which brought them $4800.

A recent shipment from one of the Christmas leases averaged $30 per ton.

The Mackin lease on the Lucky Gus made a 25-ton shipment which, it is claimed, ran about $80 per ton.

Eighty tons shipped from the Steelsmith lease on the Finley averaged $80 per ton.

The 105 specimens from Cripple Creek district collected for the Paris Exposition were selected from the Mary McKinney, Lucky Gus, Gold King, Lost Lillie, Elkton, Pharmacist, Deadwood, Zenobia, Burns, May Queen, Sheriff, Union, Pinnacle, Free Coinage, Bogart, Work, Isabella, Last Dollar, Damon and Red Umbrella.

A 24-ton shipment from the Raven netted that company $550 per ton. This batch of rich ore came from a winze on the main tunnel level.

Cripple Creek, Dec. 18th, '99.

(Special Correspondence).—The dividend of 10 cents per share, amounting to $100,000, declared on Dec. 15th by the Gold Coin Co., at Victor, makes that company's aggregate dividends for the year amount to $210,000. This company, as is generally known, is controlled by the Woods people, who also control several other dividend-paying companies, among which are the Jack Pot, whose December dividend was $75,000, and the Consolidated Gold Mines Co., that paid a $10,000 dividend at about the same time as the above.

Cripple Creek, Dec. 18th, '99.

Two strikes are reported on the Burns of the Acacia Co. One is on the McGill & Brady workings, and the other on the block under lease to William Parker and associates. The first has been made in a winze from the 600-foot level, and assays twenty to thirty ounces to the ton. From this lease it is stated that during November the net returns to the lessees was $19,000. Twenty cars of ore were sold.

The Parker strike was made in a drift at a depth of 200 feet, where an ore body 2 feet wide was cut, 14 inches of which assays seventeen ounces to the ton. New machinery is to be installed.

Cripple Creek dividends for 1899 are expected to reach $4,000,000, or nearly twice those of 1898.

A shipment of ore from the Isabella mine was made last week, the value of which was about $10 per pound. When the ore was first offered to the railroad company it was declined on account of the great risk. Subsequently it was taken by the railroad company. Other shipments of rich ore are to be made in a short time but of lower grade. The ore was sacked in the mine, hoisted at night and resorted. The second grade, it is estimated, will average $2 per pound.

Since their discovery in 1890 the mines of Cripple Creek district have produced about $67,000,000. The output for the year 1899 is estimated at over $18,000,000, from about 420,000 tons of ore, an average of about $45 per ton.

IDAHO.

BOISE COUNTY.

Work on the bedrock flume on More creek, ten miles below Idaho City, is finished, says the *Idaho World*. The head of the flume is about 150 feet below the lower end of the Stierman ranch. It is about 1800 feet long. The width is 16 feet and the depth, to the riffles, is 5 feet. The grade is 1 1-6 inches to the rod. The bottom of the upper end of the flume is a little over 3 feet below the surface of the bedrock. The cost of the construction of the flume was a little over $25,000. The flume company owns about four miles of placer ground along More creek, extending from the lower end of the Stierman ranch to Cold Springs Flat.

KOOTENAI COUNTY.

The crosscut in the Keep Cool mine, near Lakeville, which recently reached the ore shoot, has passed through 5 feet of high-grade ore. It is reported that the average value is $36 per ton in silver and lead. A crosscut is being run at a lower level to the same shoot.

SHOSHONE COUNTY.

It is reported that the Granite mine, at Nine Mile creek, near Wallace, has been sold to Finch & Campbell of Spokane. It was one of the early-day mines of the Cœur d'Alenes. It was equipped with concentrating plant situated on the opposite side of the mountain from the mine workings, the mill being lower than the mine. Ore was conveyed over the ridge by wire tramway. The ore occurs in a large dyke of intrusive rock cutting the slate of the country. The dyke averages 100 feet wide and the ore occurs irregularly scattered through it. Of late years very little has been done on the property, but operations will now be resumed.

MICHIGAN.

HOUGHTON COUNTY.

Work is to be resumed on the Trimountain with diamond drill. Starting near No. 1 shaft, the Copper Range lode will be traced if possible under heavy overburden to the Baltic line, a mile and a half, to settle the question whether or not Baltic and Copper Ridge lodes are identical.

MISSOURI.

JASPER COUNTY.

Richard A. Parker, consulting engineer of the American Zinc-Lead & Smelting Co., says: "The zinc situation is more promising than it has been for two months. There is no reason to expect better prices than $32 to $34 per ton. I expect to see jack sell at from $30 to $32 per ton right along. The American Zinc-Lead & Smelting Co.'s properties in the Joplin district are well developed and producing. So far as the methods of mining are concerned, I do not think they can be materially improved. As to milling, I can materially improve upon present methods and save a much larger percentage of ore than is now being saved. On our properties we have twelve mills, which I have examined, and have no hesitation in stating that I can decrease our cost 15%. I have shut down the mills making losses and we are now rebuilding three mills. The mills now in Joplin are all of 100 tons capacity. We contemplate building a mill of 450 tons capacity, which will require no greater expense to operate than a 100-ton mill. We propose to run double shifts, irrespective of the Miners' Association. The company is producing 350 tons of jack per week. Within six months we shall be in position to produce 650 tons weekly, and within a year to bring the production up to 800 to 1000 tons. The American Co. controls 3000 acres of zinc-producing territory in Joplin, part in fee and part under lease."

MONTANA.

The Montana Power Co. of Butte has transferred to the Montana Power Transmission Co., a New Jersey corporation, all its property, including 1900 acres of placer ground in Beaverhead and Silver Bow counties. The consideration paid was $1,775,000.

SILVER BOW COUNTY.

The commissioners appointed to appraise value of land sought to be taken for dumping purposes by the Montana Ore Purchasing Co. and Johnstown M. Co. from the Butte & Boston report that one piece containing 53 83-100 acres is worth $455,000 and another of 4 17-100 acres is worth $45,000, making a total of $500,000. The ground sought to be conveyed is placer and transfer will include mineral rights. It is on the flats near the Montana Ore Purchasing Co. smelter.

Burdette O'Connor has commenced suit against the Anaconda Copper M. Co. and the Washoe Copper Co. to enjoin the defendants from trespass in the Copper Trust lode claim and to recover the sum of $2,000,000, alleged to be due for 200,000 tons of ore extracted by means of underground workings from the Anaconda, St. Lawrence and Never Sweat mines. Plaintiff claims that the veins of ore apexing on his claim so far depart from a perpendicular as to pass beneath the surface of eight claims owned by the defendants. Judge Clancy has issued a temporary injunction and order to show cause and has made it returnable on January 20th. The suit promises to be greater than the famous suit of the Montana Ore Purchasing Co. vs. the Boston and Montana Co.

Over 8400 men are employed in the mines, mills and reduction works of Butte City. Of this number the Anaconda Co. employs 3600. The deepest mine in the district is the Green Mountain, down 2200 feet, the Mountain Con. No. 1 being next at 2000 feet. The Anaconda is 1700 feet deep and Clark's Parrot-Colusa is down 1400. A. F. Heintz' mine, the Rarus, is 1200 feet deep.

NEVADA.

ELKO COUNTY.

Rich ore has been found in the Dexter mine at Tuscarora, some of it going several thousand dollars per ton.

ESMERALDA COUNTY.

The Pacific Copper Co., with Messrs. Ballard, Martin, McCaw & Knapp as the principal stockholders, has been incorporated for the purpose of developing the Dunlap mines in Santa Fe district.

LINCOLN COUNTY.

The DeLamar mine has reduced working hours for mill men to eight hours per shift, with no reduction in wages. Heretofore twelve hours was a shift's work.

STOREY COUNTY.

The Gold Hill Miners' Union has elected the following officers for the ensuing term: President, E. P. Holmes; vice-president, Joseph Minnedew; treasurer, F. Clark; recording and financial secretary, J. B. McGinnis; conductor, Joseph Roach; warden, Richard Baglin; finance committee, Paul Roush, Joseph Crocker, Thomas Stack; trustees, P. H. Pollard, William Gray, William Donovan.

WASHOE COUNTY.

A copper prospect is being developed at Reno. The gangue is calcite and quartz, containing carbonates of copper, native copper, gold and silver. The vein is reported to be 40 feet wide and has been prospected on the surface 3000 feet.

NEW MEXICO.

GRANT COUNTY.

Owing to the excitement over the discoveries of copper in the vicinity of the Santa Rita mines, the new town of Hanover is increasing in population and there are 1500 people now in the district, most of whom are developing their properties. The Santa Fe track has been extended to the mines and a trainload of ore is being taken out daily.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Pyritic smelter at Deadwood treats daily 800 tons of ore and fluxing material at a greater rate per square foot of hearth area and at less cost per ton than any other smelter in the world. The ores are chiefly a highly silicious material from the mines about Terry peak, known as the Potsdam telluride ores. With these are charged pyritic material, limestone and copper, which latter is shipped from Butte, Mont. The great plant grew up from a small experimental furnace, constructed by Dr. Franklin R. Carpenter for the purpose of demonstrating that he could smelt Black Hills ores without either lead or copper, ores of these metals being rare in the Hills. The small furnace was a success and a large plant was built in Deadwood known as the Deadwood & Delaware Pyritic Smelter. Dr. Carpenter modified the various old processes previously in vogue in Europe, and adapted them to American conditions. The influence of this smelter has been far reaching. It was the first plant in America to do matte smelting with high silicious slags —48% to 52% and 6% to 10% Al_2O_3 (aluminous oxide). They were called Dr. Carpenter's impossible slags. The addition of copper added somewhat to the cost of treatment, but this was offset by cleaner slags and was not otherwise costlier. Pyritic smelters have been built at a number of places since the Deadwood plant became a success, and still others are talked of.

UTAH.

JUAB COUNTY.

The Carrisa mine, near Eureka, is shipping high-grade copper carbonate ore.

The Cleopatra, at Silver City, is in ore on the 370 level. It is supposed to be on the Swansea vein.

A. F. Holden, managing director of the United States Mining Co., has bought control of the Centennial Eureka mine, and will be elected president of the company.

SALT LAKE COUNTY.

The last monthly report of Mgr. J. W. Neill on the United States M. Co.'s property at Bingham states that 2161 feet of ground included in the property of the United States M. Co. at Bingham was prospected during November, of which 1256 feet were in Old Jordan and Galena group, 695 in Old Telegraph group and 210 in Niagara. Most of this work was in ore. In Old Jordan ground ore was encountered affording $196 40 per ton in gold, 67 ounces silver and 2.6% copper. This ore was on the 400 level. A new body in the Coolidge stope, on the No. 1 west, is being developed into a very large one. A drift has been put into it 45 feet, with solid ore on all sides. On No. 2 west, in same territory, an ore body has been crosscut 50 feet and drifted 60 feet, while an upraise has been made on the foot wall in solid ore for 80 feet. It is estimated that in this block there are 50,000 tons of ore. In the Old Telegraph, off the Grecian Bend level to the west, a drift has run on ore 75 feet, crosscutting the same body 70 feet. This ore shows an average of 3% copper, $8 in gold and three ounces silver, with iron excess of 20%. In Niagara group, important development has been in raise from the Spanish drift. The quartzite roll by which the ore body has been cut off was followed and old workings broken into on what was known as the front vein. These workings constitute a new apex from which work will be prosecuted. In the Mayberry and Davidson tunnels development has shown ore. The air compressor being installed will enable the management to run thirty drills, and will furnish power for each of the groups, and connections will be completed in a few days. Over a mile of pipe has been laid.

WASHINGTON.

FERRY COUNTY.

(Special Correspondence). — On the south half of the reservation a number of important strikes have been made on working properties during the past few weeks, principally in lead or copper ores. On the Rebecca, near the Columbia river, and ten miles west of the town of Keller, and ore body 25 feet wide is reported, and it is claimed that average samples across the vein assay 10% in silver and copper, but no gold. A crosscut is being run from the bottom of a 55-foot shaft—the deepest workings.

At the Iconoclast, on the outskirts of Keller, the tunnel, 190 feet in length, has crosscut a ledge of copper ore 5½ feet wide, from which samples are reported from $36 26 to $71.64, the latter consisting of $62.54 copper, $9.70 silver and $4.40 gold. The main ledge, it is estimated, will not be reached until 80 feet farther; the tunnel is being driven ahead and drifting started on the ledge just cut.

At the Crystal mine, near Fort Spokane, a third ore chute has been broken into on a drift run from the 85-foot level of No. 1 shaft. The ore is iron, copper, lead and silver, with little gold. Dump samples give about $30 total values. The ore in this property occurs in chutes, or chimneys, and the dimensions of the strike are not yet determined. Previous to the finding of this body of ore, it was estimated that there were 240 tons of ore on the dump and 1000 tons more in sight in the mine.

Another deal on a big consolidation has been effected in Wehe Camp, of the Palmer Mountain district, by which the Wehe Con. of the M. & M. Co. has incorporated twenty-six claims and invested $50,000 in the purchase and development funds. It is largely Cincinnati capital.

About $3500, largely Connecticut capital, is to be expended in development during the winter and spring on the Congress Hill group, on the south half of Bridge creek. This property has recently been incorporated under the name of Congress Copper G. M. & M. Co., and has a good showing of copper ore and some galena—both ores carrying high values in silver and some gold.

At Republic Camp it is estimated that the Mountain Lion mine now has blocked out and in sight 150,000 tons of ore that will pay to mill. It possesses the most continuous body of pay ore in the camp of the properties developed to date.

The Lone Pine-Surprise property is to have

a compressor plant and is to be developed in future by a three-compartment vertical shaft.

The crosscut tunnel on the Zala M., in the adjoining camp of Sheridan, cut the ledge on the 8th inst., at the 300 level, with a tunnel 550 feet, where the ledge is 4 feet wide and carries the same character of ore as on the upper levels—quartz impregnated with copper pyrites, large quantities of sulphurets of silver and some gold. Carload shipments from the upper workings showed average returns from the smelter of $260 per ton, only first-grade ore being shipped.

Republic, Dec. 12th, '99.

OKANOGAN COUNTY.

Between Loomis and Conconully, on Aeneas mountain, the Q. S. M. Co. is developing a large copper prospect by means of a tunnel. There are eighteen claims in the group, the principal vein being a zone 300 feet wide extending through three claims. Copper shows at many places along this belt, assays running from a fraction to 20% copper, with small values in gold and silver.

SNOHOMISH COUNTY.

At the U. S. group of mines, near Monte Cristo, a large body of decomposed quartz, containing free gold, has been uncovered. A tunnel is being run in ore. The group consists of fifteen claims and seven millsites, on the Sultan river, eight miles from its source.

WYOMING.

CARBON COUNTY.

The Sierra Madre M. & M. Co. has been organized to operate mines of the Grand Encampment district. They have bought the Little Marion on Miner creek, the Atlas, Bonafide and Brooklin, joining the Kurtz-Chatterton mine, also a group near the Home Fraction.

FOREIGN.

CANADA.

It is reported a new diamond field has been discovered on the north shore of Lake Superior. Numerous diamonds have been found in the glacial drift south of Lake Superior, which are supposed to have come from the north.

The Ontario Government has a plan to control the nickel ores in Sudbury district in the interest of the British Government. Acceptance would mean the placing of an embargo on the continued export to the United States for naval purposes of the nickel product of the Canadian Copper Company, which is composed mainly of Cleveland, Ohio, capitalists. This company has up to now had a practical monopoly of the supply of nickel for American armor.

In the seven years 1892-1898 the quantity of ore smelted and reduced in the Sudbury district was 891,852 tons, and the estimated metallic contents were 29,705,000 pounds of nickel and 34,570,500 pounds of copper. At the selling price of matte at the furnaces, which is the form in which it is exported to the refineries in the United States, the total value of the nickel product for the seven years was $3,294,060, and of the copper $1,302,805, or a total of $4,596,865. At the average selling price of the metals during the seven years this would amount to $10,396,760 for nickel and $3,975,607 for copper, or a total of $14,372,367.

The United States would not be prevented from getting nickel, even if Great Britain and France should attempt to control the supply of nickel ore. The principal deposits are at Sudbury, Canada, and in New Caledonia, a French island in the Pacific, but nickel is being produced in Oregon and in other parts of the United States. If England and France should refuse to allow their nickel to be sold to other nations, it would probably increase the price in the United States, but would not entirely shut off the supply.

BRITISH COLUMBIA.

In the Columbia Kootenay mine at Rossland, Supt. W. L. Haskins has been making a record in drifting. During sixty-one days a tunnel in 1000 feet was advanced 676 feet. In this work three shifts, eight hours each, were employed, two power drills mounted on a single bar being used. This makes a record for the camp of an average of 11.08 feet per day, or 3 69+ feet per shift. The work was accomplished at a cost of $13.50 per foot, which includes wages of miners, muckers, trammers, air, rails, smith work, explosives, light, etc. The character of the ground may be judged by the item of powder alone, which was $3 per foot. The rock passed through was diorite.

The Monte Cristo will ship two carloads of ore daily to the Trail smelter.

The Rambler-Cariboo Con. M. C. is sending 200 tons of ore to United States smelters.

The placer mines near Lake Atlin are to be worked by hydraulicing, American companies being formed for this purpose. Next year will see a revival in the mining industry of Atlin. On Willow and Moose Creeks, emptying into Atlin Lake, the owners of the claims along those two creeks have formed consolidations. On Willow Creek the company of which Dr. Young is at the head, controls 1700 acres. An English syndicate has bonded mines on Nugget point for $35,000. British capital is being invested in the country and new mines will be explored during the winter and exploited next spring. Since the trouble caused by the exclusion laws has been settled American investors are putting money into promising claims.

MEXICO.

It is reported in New York that the Kansas City Smelting & Refining Co. and Guggenheim Bros. have jointly invested $12,000,000 in a scheme to control a number of the best silver-producing mines in Mexico.

NEW ZEALAND.

New Zealand *Mining*: During the month ending October 26th £58,350 worth of gold was reported, and there were still several returns to come in.——A cinnabar lode has been discovered by Mr. Gibb on the Waitahuna ranges, twelve miles from Berwick, and halfway between that place and Waipori. Small pieces of cinnabar have been frequently picked up on the river bank, and a number of prospectors have been engaged for some weeks looking for the main lode, which has been found. A number of claims have been pegged off. It is an east and west lode of varying width, the walls on an average being 15 inches apart. The ore is high grade.

Industrial Notes.

—Alaska's coasts are to be accurately surveyed.

—In Colorado lignite coal is to be laid down for $3.50 per ton.

— Denver, Colo., has $35,000,000 surplus money on deposit.

—The U. S. homestead law will be extended to the Philippines.

—There are 350 miners at work in the coal mines at Red Canyon, Wyo.

—Raymond, Cal., is furnishing granite for the new San Francisco postoffice.

—The American Steel & Wire Co. is credited with having made $1,800,000 last month.

—The San Francisco mint produced $58,258,000 gold coin in the fiscal year ending June 30, '99.

—There is an advance of 20% in the price of leather belting. Glycerine is now held at 13 cents per lb.

—There will be a general advance in railroad freights on all roads east and west of Chicago Jan. 1st.

—The Colorado Fuel & Iron Co. proposes manufacturing coke, under the Hemingway patents, in Colorado and Utah.

—Deep snow in the Sierras and heavy continued rains in the valleys and along the coast insure a prosperous year for California.

—Jones & Laughlin Co. of Pittsburg, Pa., has advanced the wages of 1000 employes in its steel department 10%, to take effect Jan. 1st. A similar advance in all departments is practically assured.

—The Nevada, California & Oregon Railroad, which began its extension from Amedee, Cal., last April, has halted at Juniper ridge, Lassen county, Cal., 50 miles from Amedee and 110 miles from Lakeview, Or.

—The Commissioner of Railways renews his recommendation for a transcontinental air line railway from Kansas City, Mo., to San Diego, Cal. Similar routes, the Commissioner adds, should be opened between the cities of Chicago and San Francisco, Chicago and Seattle.

—The total tonnage of the "Soo" (Sault Ste. Marie) canal has been computed to Nov. 30th and aggregates 24,636,552 tons of freight, an increase of 15% as compared with the entire year of 1898. Upward of 54,279,000 bushels of wheat, 27,680,000 bushels of other grains and 6,804,000 barrels of flour passed through the canal. Of this flour about 35% was for direct export and nearly as great a proportion of the wheat. The great bulk of the lake commerce of the year has been iron ore.

—Chicago is to take official notice of increasing electrolysis, and will try to force street railway companies to provide their rails with proper connection to prevent leakage of electricity and consequent damage to water and other pipes. A burst in a water main was recently reported and the men found on laying bare the 6-inch pipe that a hole 1 inch in diameter had been eaten entirely through the pipe, while in other portions immediately about the leak the pipe was almost as badly eaten away. The leak was 9 feet below the surface of the ground, immediately under a street car line. In another street an 8-inch main burst, and excavation showed a large hole had been eaten through the iron. This main was also 9 feet below the street car tracks.

Recently Declared Mining Dividends.

Ontario S. M. Co., Utah, $15,000, Dec. 20.

Mt. Rosa M. & M. Co., Colo., $40,000; payable Dec. 23.

Bunker Hill & Sullivan M. & C. Co., Idaho, $33,000, Dec. 18.

Tamarack C. M. Co., Mich., $6 per share; payable Dec. 28.

Pennsylvania G. M. Co., Grass Valley, Cal., 20 cents per share.

Jack Pot M. Co., Cripple Creek, Colo., $75,000; payable Dec. 23.

Gold Coin M. & L. Co., Victor, Colo., $10,000; payable Dec. 25.

Calumet & Hecla C. M. Co., Mich., $2,000,000; payable Dec. 29.

Consolidated G. M. Co., Cripple Creek, Colo., $10,000; payable Dec. 23.

Silver King S. M. Co., Utah, 33⅓ cents per share, $50,000; payable Dec. 28.

Isabella G. M. Co., Cripple Creek, Colo., $67,000; payable Dec. 23. Total, $504,000.

Portland G. M. Co., Cripple Creek, Colo., $60,000; Dec. 15. Total to date, $2,557,000.

Yellow Aster M. & M. Co., Randsburg, Cal., $20,000, Dec. 11. Total to date, $313,789.

American Zinc, Lead & Smelting Co., Missouri, quarterly dividend, $1; payable Jan. 1, 1900.

Rambler-Cariboo Con. M. Co., B. C., 1 cent per share; payable Jan. 10, 1900. Total to date, $71,000.

Homestake G. M. Co., South Dakota, regular monthly dividend 25 cents per share; extra 25 cents, $105,000; payable Dec. 26.

Personal.

E. P. JENNINGS is the new Supt. Star Con. mine, Utah.

VICTOR M. CLEMENT is examining mining property in Utah.

W. R. BEALL, Supt. Cleveland Con. mines, Ono, Cal., is in San Francisco.

R. G. LEGG is the new manager of the Dexter M. Co., Tuscarora, Nevada.

W. B. MURDOCH returned to San Francisco this week from Lyon county, Nevada.

J. E. HASKELL is now Mgr. Penn G. M. Co., Prescott, Ariz., succeeding E. E. Wann.

C. DOBBELSTEIN, Mgr. Gray Rocks copper properties, Stillwater, Cal., is in San Francisco.

CAPT. PHILLIPS has resigned the mine managership of the Broken Hill, N. S. W., Junction S. M. Co.

B. SULLIVAN of Eureka, Utah, has been engaged to superintend the Little Chief mine, Tintic district.

SYDNEY SMITH of San Francisco was examining mining properties in Shasta county, Cal., last week.

D. C. JACKLING goes from Mercur, Utah, Jan. 1st, to take charge of mining property at Republic, Wash.

GEO. O. BRADLEY of Salt Lake City, Utah, will act in 1900 as consulting engineer War Eagle Con. M. Co., Idaho.

E. C. HOMERSHAM has gone from South Africa to West Australia, and is there managing the Sons of Gwalia mine.

GEO. E. BATEMAN has been appointed Supt. Black Spider mine, Keswick (Taylor P. O.), Cal. He takes charge Dec. 27th.

A. H. WADDELL, formerly of the Union Iron Works, San Francisco, has charge of a gold dredger at Adams Flat, N. Z.

F. H. HARVEY, E. M., of Galt, Cal., has recently completed an examination of the Lamphear mine, near Mokelumne Hill, Cal.

J. F. COLEMAN, bonding owner Mammoth Copper mines, Kennett, Cal., is in San Francisco, on his return from Halifax, Nova Scotia.

M. M. O'SHAUGHNESSY has returned to San Francisco from the Hawaiian Islands. He returns there next month to supervise an irrigation proposition and will remain there during 1900.

L. M. HILL of Oakland, Cal., has been appointed consulting engineer of the Comstock Pumping Association, to take charge of the installation of electric plants on the Comstock lode at Virginia City, Nev.

C. A. FORE of Denver, Colo., is returning from Nome. He says there are ninety miles of beach rich in gold, but thinks the country will be overdone next summer, as the rush will beat the one of '97 to the Klondike. He says that fraud is being perpetrated at Nome in the direction of recording claims by proxy. It costs $25 to record a placer claim by power of attorney, and Mr. Fore says hundreds of fictitious names are being used in recording these 20-acre placer claims; some proxies have fifty, which gives them color of title to 1000 acres of placer grouud. The law, however, compels a man to find gold on a claim before he can record it, and as hundreds of these claims have never been touched by a pick or shovel, Mr. Fore feels sure that very little respect will be shown fictitious claimants when the miners go to Nome next summer.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 12, 1899.

638,689.—FURNACE—J. B. Archer, Oakland, Cal.
638,904.—CIGARETTE MACHINE—A. E. Buckingham, S. F.
638,863.—ROLLER BEARING—E. C. Chatham, S. F.
638,701.—NEEDLE THREADER—H. M. Childers, Ontario, Or.
638,910.—ROTARY ENGINE—E. P. Couture, Gualala, Cal.
639,152.—RAISIN STEMMER—C. S. Cox, Fresno, Cal.
639,205.—BEARING—G. Durnerin, Los Angeles, Cal.
638,918.—ELEVATOR—E. M. Fraser, S. F.
638,870.—WATERPROOF FLOORS, ETC.—P. H. Jackson, S. F.
639,056.—TICKET HOLDER—M. H. Jones, Nogales, Ariz.
638,729.—HITCHING HORSES—A. W. Lundberg, Interbay, Wash.
639,074.—WEIGHING MACHINE—S P. Mackey, Ridgefield, Wash.
638,875.—SKIRT MARKER—Isabel E. Malarkey, S. F.
638,876.—R. R. TRACK CROSSING—M. D. Meyer, S. F.
639,206.—PERFORATOR—A. C. Miller, Corona, Cal.
639,089.—AMALGAMATOR—I. A. Palmer, Seattle, Wash.
638,883.—DREDGER—R. A. Perry, Oakland, Cal.
638,886.—TARGET—J. Pillorget, S. F.
639,183.—RAIL JOINT—F. N. Plomondon, Matlock, Wash.
638,939.—ROCK DRILL—P. H. Reardon, S. F.
638,814.—PIPE TONGS—A. J. Sawin, Ventura, Cal.
639,101.—PRINTING ROLL PAPER—G. H. Schubert, La Porte, Cal.
638,890.—PUMP—T. J. Sparks, S. F.
639,202.—R. R. SIGNAL—W. R. Stearns, Portland, Or.
638,895.—ELECTRICAL TREE—G. H. Wallis, S. F.
639,203.—BORING MACHINE—Woodhill & Hulse, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Catalogues Received.

"Air and Gas Compressors" is the title of a 136-page treatise thereon embracing much that any one interested therein would like to know or have verified. The pamphlet is an illustrated encyclopedia of compressed information on air and gas compressors, and its typographic excellence is commensurate with the practical value of its contents. It will be sent by its publishers, the Rand Drill Co., 100 Broadway, N. Y. City, on request.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRICAL TREE.—George H. Wallis, San Francisco, Cal., assignor to Washburn & Moen Manufacturing Co., of Worcester, Mass. No. 638,895. Dated Dec. 12, 1899. The object of this invention is to produce a tree-like form for illuminating display purposes. It consists in the formation of the body of a tree of submarine or similar cable, with branches formed by untwisting the wires of the cable and extending them outwardly from the body; electric lights fixed to said branches and circuit wires through which the current is supplied thereto. Rings may be supported around the body of the tree at intervals with devices by which electric lights can be suspended therefrom.

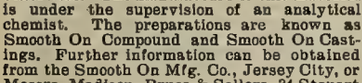
TRACK CROSSING PROTECTOR.—M. D. Meyer, San Francisco, Cal. No. 638,876. Dated Dec. 12, 1899. This invention is designed to provide a device which will make a noiseless crossing at points where two lines of track intersect each other, and to prevent the constant jar and concussion caused by the passing of the wheels over the open joints formed by such crossings. It consists essentially in the employment of supplemental supporting surfaces extending across the tracks interior to the rails and against the inner sides thereof, having a base support independent of the crossing rails. These surfaces form a support upon which the wheel flanges travel and maintain the wheel treads out of contact with the rails while passing over the transverse line. Exterior to this line, on each side, are independent extensions which are inclined so that wheels are gradually lifted on approaching the crossing and again lowered upon the rails after passing the crossing.

ROLLER BEARING.—E. C. Chatham, San Francisco, Cal. No. 638,863. Dated Dec. 12, 1899. This invention relates to anti-frictional bearings for journals and the like. It consists of rollers adapted to travel in contact with the journal or shaft, and an exterior journal box with which the exterior surface of the rollers form contact. Intermediate rollers are placed between the main ones and have their ends projecting beyond the ends of the first named rollers, and these intermediate rollers are provided with V-shaped grooves. Caps are fixed to the journal and have channels formed in them to receive the projecting ends of the intermediate rollers, and form a track therefor. Turnable rings are fitted interior to the caps, having their outer periphery shaped to fit and engage the V-shaped grooves in the ends of the intermediate rollers.

DREDGER.—R. A. Perry, Oakland, Cal., assignor of one-half to the Atlantic Gulf & Pacific Co., of West Virginia. No. 638,883. Dated Dec. 12, 1899. This invention relates to improvements in dredging and excavating apparatus. It comprises a scow with a suction pump, engines and other machinery, and which is fixed by spuds driven through suitable guides or clamps into the bed of the stream, or other body of water. Upon the front of the scow is mounted a ladder, so-called, with peculiar arrangements of joints which allow it to swing up, down, and from side to side, and this ladder carries the peculiarly arranged excavators at its front, with the necessary mechanism for transmitting power from the machinery on the scow to operate them. In conjunction with these excavators is a suction pipe, also carried upon the ladder and connected with the suction pump on the scow by a peculiarly arranged joint which allows of the universal movement necessary in raising and swinging the ladder without disturbing the continuity of the connections.

PUMP.—T. J. Sparks, Magalia, Cal., assignor of one-half to F. M. Austin, San Francisco, Cal. No. 638,890. Dated Dec. 12, 1899. This invention is designed to improve the class of pumps having a plunger reciprocating in the pump cylinder, and two sets of suction and discharge pipes, and valves connecting respectively with the opposite ends of the cylinder and discharging into a common conductor. The pump is formed with independent heads in the form of cross-couplings, a detachable cylinder connecting one head with the other, the heads of lateral extensions and enlarged valve chambers fitting to said extensions. The valve seats are also removably fitted in the extensions and located exterior to the chambers. Valves which are removable with the seats have tail extensions projecting into the chambers, and springs acting against them to insure the quick closing of the valves. Bolts pass through the walls of the chambers and of the valve seats, and detachably fix the chambers and seats to the extensions of the cross couplings. A peculiar arrangement of packing is adapted to surround the plunger rod where it passes through the stuffing box.

WATERPROOF SIDEWALK, FLOOR, OR ROOF CONSTRUCTION.—P. H. Jackson, San Francisco, Cal. No. 638,870. Dated Dec. 12, 1899. This invention comprises a means for providing for expansion and contraction of the parts of a sidewalk, floor or roof which are subject to expansion and contraction due to atmospheric changes and to prevent the cracking of the concrete surface of the structure. It also comprises a base formed of corrugated metal plates overlapped and interlocking at the ends with supporting beams and metal bars extending parallel therewith, and means



by which the bars are clamped across the overlapping ends of the seats. The filling of cementing material may be introduced between the interlocking ends of the seats to prevent the passage of water in the case of leakage from above, and a filling and surface of concrete is spread upon the corrugated plates or sheets. The upper surface of this concrete is formed with deep intersecting grooves, partially separating it into squares or other shapes, so that the upper portion may be subjected to expansion and contraction without affecting the lower portion.

DEVICE FOR MAKING CIGARETTES.—A. E. Buckingham, Oakland, Cal., eleven-sixteenths assigned to W. de Pons and F. Klingeberg of same place, and H. C. Sexton and A. Castelazo, of San Francisco, Cal. No. 638,904. Dated Dec. 12, 1899. This device for easily manufacturing cigarettes and the like consists of a tube closed at one end and open at the other, having a plunger slidable therein, and a stem extending outwardly through the closed end, and a head by which it may be reciprocated, and which also serves as a lock to retain the parts in position when not in use. The tube may be filled with loose tobacco when the plunger has been withdrawn to the head, and the paper of which the cigarette is formed is rolled around the exterior of the tube, the other end being folded and closed. By then forcing the plunger outward the tobacco is pressed into the wrapper, which is simultaneously forced off the tube so that when it leaves the tube it is filled with the tobacco which is properly packed within it. The open end may then be closed over the tobacco and it is in condition for use.

Commercial Paragraphs.

A. M. GRANT, Utah representative of the Colorado Iron Works Co. of Denver, Colo., has an order from the Anaconda, Montana, Co. for a set of 54x8 rolls.

SMOOTH ON is a metallic putty, so to speak, especially adapted for closing cracks in boilers, putting on patches, and other work where metal surfaces are to be brought together to form a solid piece. It is a dry, powdered composition; when mixed with water to the consistency of a stiff putty becomes hard and of much the same consistency as iron, so that it can be finished with a smooth surface. It will withstand heat and vibration and is affected by heat and cold the same as iron. It increases in bulk when unconfined about 5% when it hardens, and this action is what makes it perfectly tight when confined between two iron surfaces or in an opening or fracture. By remembering this action the mechanic in the use of this compound can utilize it in many ways in repairs in cast and wrought iron work, and on account of its strength to withstand heat, pressure and vibration. In ship, engine and boiler building plants there is a demand for a material that may readily be applied in the form of patches where fractures occur, and also in the case of boilers and piping for permanent joints, mainstay braces, stay screw nuts, etc. Every engineer knows the value of a reliable compound for these purposes as against the old-fashioned soft patch cement made of red lead and iron borings. The manufacturers say that the discovery and use of Smooth On Compound has met with success and has made easy many repairs that it would be difficult, if not impossible, to do otherwise. The manufacture of this material is under the supervision of an analytical chemist. The preparations are known as Smooth On Compound and Smooth On Castings. Further information can be obtained from the Smooth On Mfg. Co., Jersey City, or Messrs. Madison, Bruce & Sellers, 34 Steuart street, San Francisco, Cal.

A Problem
in mining is how to dispose of muddy water in sinking.
Our Miners' Jackhead Plunger Sinking Pump solves it.
No smooth cylinder to wear.
Seldom requires packing.
Forces water on the down stroke so that weight of pump rod can be adjusted to balance water column.

JUST THE PUMP FOR MUDDY WATER.

Write us about your conditions and we will quote you on size and kind of Pump best suited to your requirements.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

NO. 1 LAMP.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1½ C. P.	Price complete, $4.50.		For meter reading only.
No. 2 " 3 " 4 "	" "	6.00.	For Miners and general use.
No. 3 " 1½ " 10 "	" "	12.00.	For several persons to work by.
No. 4 " 3 " 4 "	" "	6.00.	Boiler Makers and Chimney Sweeps.

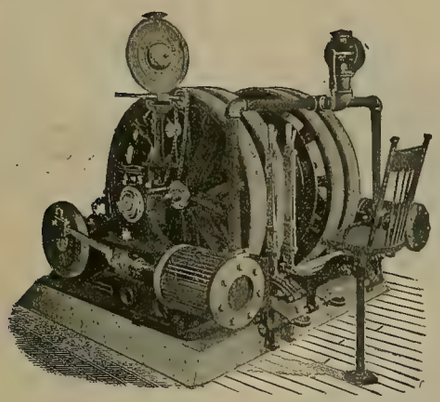
THE JOHNSTON CONCENTRATOR.



DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

THE IDEAL CONVEYOR BELT

LEVIATHAN

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.

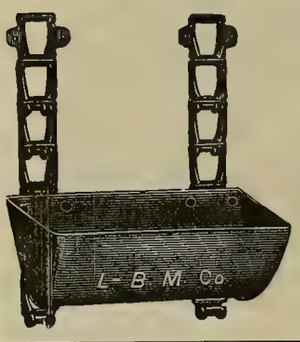
WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

"UNION" OMBINED OM PRESSORS—20, 30, 40 h. p.
HOISTS and OMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**

Market Reports.

SAN FRANCISCO, Dec. 21, 1899.

SILVER.—London (925 fine), 27½d; New York, 59; San Francisco, 59; Mexican Dollars, 47½@48¾; New York exchange, sight, 12½; telegraphic, 15 cents premium.

LEAD.—New York reports steady, $4.70 bid, $4.75 asked; brokers' price, $4.45.

London, Spanish lead, £17 3s 9d.

Local, pipe, 7¼@7½c; sheet, 7¼@8¼c; pig, 6¾c; bar, 6¾c.

COPPER.—New York reports Lake at $16.50; brokers' price, $16.75. Local—Mill copper plates, 23¾c.

Copper is lower than in several months past, being quoted at 16¾ cents. The production and export of copper for the month of November by United States mines was 19,817 tons; produced by outside sources, estimated, 13,400 tons; exports, 10,809 tons (all of 2240 pounds); produced by foreign reporting mines, 7896 tons.

Official government returns of copper exports for the year 1898 and the first ten months of 1899 are shown in the following table:

INGOTS, BARS, ETC.	1899, lbs.	1898, lbs.
United Kingdom	38,621,239	68,530,104
France	44,239,845	41,906,190
Germany	39,828,447	36,174,107
Other Europe	64,572,034	88,267,914
British N. America	849,445	1,264,818
Mexico	249,373	237,742
Other countries	27,450	171,749
Totals	188,388,333	236,552,624

COPPER MATTE.	Tons.	Tons.
United Kingdom	463	4,350
Germany	....	2
Mexico	2,169	3,026
Other countries	....	....
Totals	2,632	7,378

Total values of both $31,539,113 $27,636,060

IRON.—American, soft, $24@25.50 per ton; Scotch, $27.50 Local bar, 2¾c per lb.

THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes.

SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY.

WIRE TRAMWAYS (Single and Double Rope Systems),

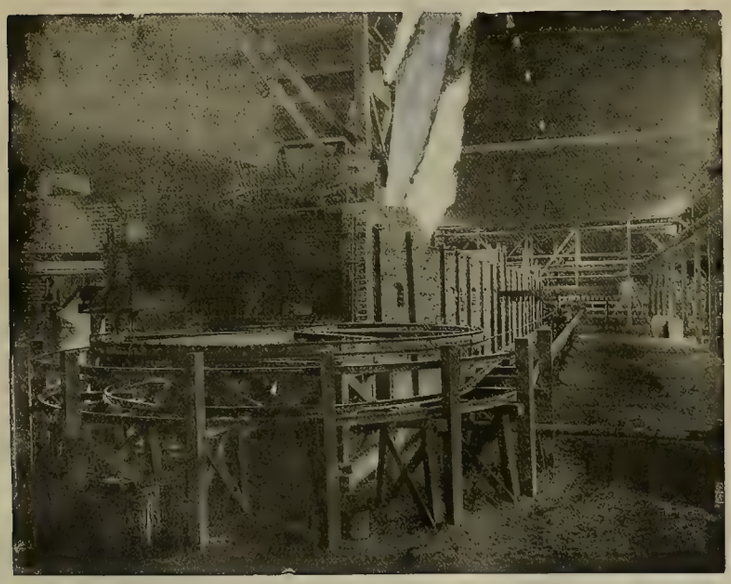
Cableways, Transmission by Wire Ropes,
Incline Planes, Cable Grips,
Logging by Cables, Automatic Loaders,

PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,

DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

Improved GRIP PULLEY.



Patents Nos. 483,442; 610,353.

EFFECTIVE, SIMPLE, AUTOMATIC.

Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet.
Correspondence Solicited.

PERSPECTIVE VIEW OF FURNACE.

PARKE & LACY CO.,

21 & 23 FREMONT ST., SAN FRANCISCO, CAL.

Mining Machinery & Supplies.

—SOLE AGENT FOR—

INGERSOLL-SERGEANT ROCK DRILLS AND AIR COMPRESSORS,
KNOWLES PUMPS and PULSOMETER PUMPS, BULLOCK DIAMOND DRILLS.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

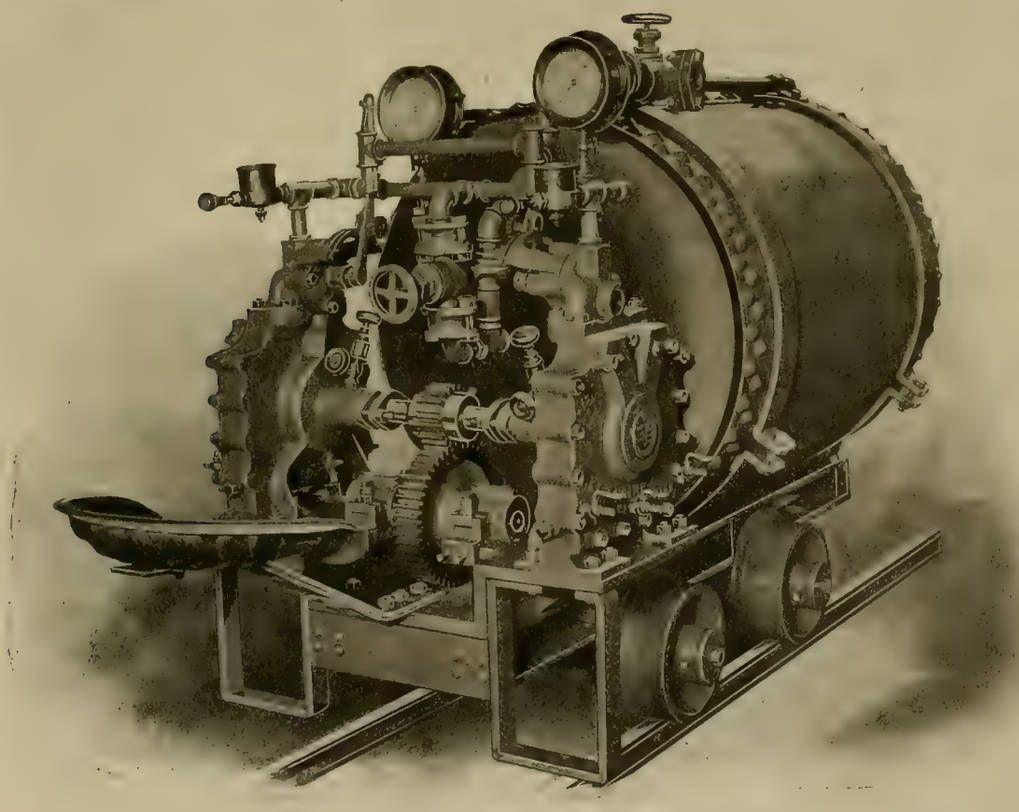
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.



No. 2060.—VOLUME LXXIX. Number 27. SAN FRANCISCO, SATURDAY, DECEMBER 30, 1899. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Compressed Air Locomotive.

As a motive power, compressed air essays to supply the same demands met by steam and electricity. In many forms of industrial appliance such supply has been noted herein. The field of locomotion is an alluring one, and, stimulated by the success of the electric locomotive, compressed air essays equal advance. One form of compressed air locomotive is herewith illustrated. It was designed and built by E. A. Rix of San Francisco, Cal., for the Empire mine, Grass Valley, Cal., where it ran one-half mile into the breast of the drift and back again to the shaft, on its outer trip hauling five mining cars, each carrying one ton ore, the weight of the train being about 7½ tons, exclusive of the motor, which weighs 3000 pounds. The track was a winding one, and had in places a 3 per cent grade. The locomotive is said to have reduced the cost of haulage from 25 cents per ton to 6 cents, the track being 18-inch gauge, wheel base 30 inches; the receiver on the motor 35 inches diameter, 54 inches long. In connection therewith was used a trailer, carrying another receiver 35 inches diameter and 60 inches long. The sharp turns in the track, some with a 10-foot radius, necessitated this division of air storage. The pressure was about 400 pounds. Two 4 H. P. rectangular piston engines are connected, one to each end of the upper shaft, a pinion on which meshes into the large gear below. These reversible engines have an average speed of 550 rotations per minute. The axle connection, invisible in the picture, is by cut sprockets and chains, the motion of the engine shaft to the axle being 4 to 1. The motorman or engineer is duly accommodated with a seat resembling that of an old-fashioned mowing machine; the two rectangular straps hanging down near the track are for his feet.

A Hydraulic Mine in Trinity County, Cal.

A Narrow Gauge Compressed Air Locomotive

Hydraulicking in California.

Since so much has been said about the inhibition of hydraulic mining in California, many have gotten the impression that this class of mining has practically ceased in the State. While this branch of the mining industry has been placed under certain restrictions, still there are over 200 mines working in the area affected by these restrictions, operating under permits from the United States Debris Commission, which stipulate how mining shall be conducted, how debris shall be impounded, etc. In the northern counties, where the streams are not tributary to the Sacramento river, this branch of mining is carried on without restraint, and some large mines are at work. The accompanying engraving is that of a typical hydraulic mine in operation in Trinity county. It shows two monitors tearing down an elevated gravel bank of the present river system, lying at the foot of a mountain. The flumes and bed-rock drains can be easily distinguished as well as the buildings and piles of lumber used in the construction of the flumes, etc. The picture also shows the lower limit of the snow line. While the mountains are robed in a mantle of white it will be observed that no snow is seen about the mine or along the river bottom.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Largest Circulation of Any Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Davis 771.

San Francisco, December 30, 1899.

TABLE OF CONTENTS.

ILLUSTRATIONS.—A Hydraulic Mine in Trinity Co., Cal.; A Narrow Gauge Compressed Air Locomotive, 741. A Sheeted Laccolite; Typical Laccolite; A Postular Uplift, 745. Crushing Machine—For Breaking "Run-of-Mine" Coal; Mixing and Weighing Room, 746. Engine and Boiler Room, 747. Cross Section of a Cape Nome Claim; Sketch Showing Method of Wiring, 748. Building an Arrastra; The Miners' Home; Hoisting with a Horse Whim; The First Hoisting Plant, 749. Latest Mining and Metallurgical Patents, 753.

EDITORIAL.—Hydraulicking in California; A Compressed Air Locomotive, 741. A Century's Progress; Miscellaneous, 742.

MINING SUMMARY.—750-751.

LATEST MARKET REPORTS.—752.

MISCELLANEOUS.—Concentrates, 743. The Cripple Creek Gold Fields; Electroplated Steamships, 744. Laccolites and Their Relation to Ore Deposits; World's Production of Gold and Silver, 745. The Petrified Forests of Arizona; Utilizing Coal Waste, 746. A Theory of the Genesis of Ore Deposits; Zinc Deposits in Missouri, 747. The Coast of Alaska from St. Michael to Point Barrow; A System of Mine Signalling, 748. The Occurrence of Tin; Typical Mining Scenes, 749. Industrial Notes; Personal; Commercial Paragraphs; Recently Declared Mining Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Books Received, 751-752. Latest Mining and Metallurgical Patents; Spruce Wood, 753.

DURING the past year Leadville, Colo., has furnished a notable example of what may be accomplished by a local company. The Home Mining Co. of that city have successfully undertaken the unwatering and operation of mines abandoned by others and their success is acting as a stimulus to others to do likewise.

THUS far England has made no material progress in the war in the Transvaal; if the reported purchase of Delagoa bay and adjacent territory from Portugal be verified it will give England an advantage she did not previously possess, as she can then successfully blockade that port and reach the capital of the South African Republic. London considers the cessation of gold production in the Transvaal but temporary.

THE annual gold output of California for the past thirteen years has not fallen below eleven millions of dollars, the lowest being in 1889, when it was $11,212,913. From that date it steadily increased until 1896, when it had reached $17,181,562. The following two years production dropped a little below sixteen millions owing to dry summer seasons, and the year just closing has suffered from like cause, but it is believed that the output of '99 will exceed sixteen millions. During the past three years a number of old mines, which have been idle for many years, have been reopened, and the year 1900 will find a number of them on a producing basis, their mills being about completed or building, and still other old mines and numerous new ones are being opened. Whether the rain and snowfall of this season will be sufficient to admit of continuous mining operations throughout the year no one can foretell, but in the event of abundant and continuous water supply California's gold production should pass the twenty million dollar mark.

A GREAT many of the failures made in mining are due to the inexperience of the managers. A thoroughly trained business man who has had no experience in mining or metallurgy could scarcely be expected to outline the plant, mechanical methods and operation of a large mining concern, yet there are those who essay such tasks, as many failures attest. Where companies or individuals are seeking mining investment, it will pay them well not only to employ a man to report on the property, but also to engage a competent engineer of known experience to arrange the mining and milling plant; and, when built, to place each department of the concern in charge of an experienced specialist, who has achieved success elsewhere. This will insure the best results; and, having done this, if the venture prove unprofitable, it will be known that it can not be made profitable by others. When this policy is pursued, failure rarely results. One had as well select a successful merchant to design and erect a suspension bridge or a modern steel building as to engage such a man—successful though he may be in commercial affairs—to plan the development and equipment of a mine or a metallurgical plant.

A Century's Progress.

For convenience and necessity man divides what is called "time" into arbitrary periods. However interesting it might be to speculate on what æons of "time" have elapsed since human records began on this planet, it is manifest that the existing arrangements of days and years is the most convenient, based upon the daily revolution of the earth and its annual journey around the sun. It is customary to group a hundred of these annual revolutions, calling such aggregation a "century," and to look upon any one of those as a distinct period. Thus we speak of the "sixteenth" century, the "eighteenth" century. While, of course, there is no such absolute entity, yet it is the general custom, as universal as the naming of the days of the week or of the months of the year.

Hence we speak of the "nineteenth" century, of which one year remains before it rounds to completion, Dec. 31st, 1900.

The industrial progress of this century far exceeds in extent and import that of any similar period in the history of mankind. Science is organized knowledge; all the progress of the closing century has been along scientific lines; this elapsing hundred years may be styled "the century of science."

It is by contrast that advance can be most strikingly shown. Contrast Spain of 1799 with Spain of 1899. She then held South America, the Antilles Central America, Mexico, California, Texas, New Mexico, Arizona. Now she holds feeble sway over only a part of the Iberian peninsula. Take the United States in 1799, a fringe of settlements along the Atlantic sea coast—now a world power bounded only by duty and destiny. In 1799 there was no such nation as Italy, or Germany. Russia was still a Tartar camp, Japan and China were sealed, Australia merely a geographical fact. That last country is worthy of notice. It took this nation 200 years to assemble a population of 3,000,000; Australia did it in sixty years. In the last few weeks the different provinces have organized into a commonwealth. In another century it may become a first-class power.

Turning from politics to literature—another domain of science—the spread of popular intelligence is in shining contrast to the cramped diffusion of knowledge in the closing years of the last century. The printing press has been among the most potent factors in the world's progress, and, as compared with its predecessors, the press of the nineteenth century has been as much of this century's creation as many other inventions during that period.

Geography and exploration gave general knowledge of the globe's surface; chemistry created a new earth; the ban was taken off the human mind; men dared to think and act upon their convictions; they ceased to believe that a thing was so merely because they were told it was; fear, that great deterrent, became less powerful; timidity vanished, and all things became possible to the scientist.

Coming from the abstract to the concrete, the recreation of the world since the days of our grandfathers is manifest. At the beginning of this century means of locomotion were the same as in the days of Herodotus. Sail on the sea and the horse on the land marked the same limits of speed in the early years of the nineteenth century, A. D., that they did in 1900, B. C. This little earth seemed but recently a mighty void; now steam has dwarfed space and electricity has annihilated duration of time in communication. Then savage and civilized alike had the same means of making fire, but one remove from the stone age; then steel was a costly secret product. Now the Bessemer process has made it cheaper than iron formerly was. It is a long step from Lavoisier and Priestley's discovery of oxygen to the liquefaction of hydrogen; from the courier horseman to the battlefield cablegram, which publishes, 10,000 miles away, the details of the fight before the fallen have grown cold in death; from the frigate Constitution to the battleship Oregon; from Sir Humphrey Davy's electric spark to the eighty-mile California transmission of 40,000 volts; from the six months ox team mail across the Continent to the instantaneous reproduction of human speech over thousands of miles of desert and mountain; from the dark, chain-barred, narrow street to the broad, brilliant thoroughfare; from the fanciful dream of the eighteenth century technologist to the fruition of the plans of the nineteenth century engineer.

"There is nothing new under the sun," was almost as true in the first year of this century as it was in the days of Solomon. It is not exaggeration to say that more material progress has been made in the last hundred years than in all the preceding ages of man. While this century was heir to all the ages, it was but a scanty heritage; what this century bequeaths to its successors is a legacy of surpassing value.

To merely index by name the scientific achievements of the century would take many volumes; in the limits of a short article nothing is possible but briefest indication of the patent fact.

Probably no part of the domain of scientific progress is more marked than that of mining and metallurgy. Prior to this century the science and art of mining did not exist. The nineteenth century sees the experiments, trials and successes of modern mining methods; it has also seen the advancement of the miner from a serf and savage to a prince of profitable industry; it has raised, dignified and ennobled the miner and made him at least the equal of any other human creature who stands erect and assumes the godlike attributes of freedom and a man. The mining and scientific world is the creature of the closing century. When this century began the miner was degraded; the mining industry did not exist. Now it is the great basic industry of the world, and the miner is known as a potent factor in general progress, and in all the arts of peace or war his influence is felt and his power recognized. There is nothing great in this universe but man; there is nothing great in man but mind, and the mind of the miner has made subject the earth's resources, has transformed the face of nature, has made possible the present wealth and advancement and pioneered the progress of the human race in every land.

In this country is this most manifest. The great western commonwealths are the miner's creation; this entire west half of America owes its existence to the miner, thus creating markets for the rest of the nation to the great common benefit of the entire country. Without attempt to create an atmosphere in which to flap the wings of fancy it is fair to assume that this substantial progress due so largely to the miner only manifests continuation on even a larger scale of such development in the century that lies ahead. The miner of the twentieth century owes a great debt to his predecessor of the nineteenth, which he can best discharge by keeping up the same rate of progress, for mining is a progressive science, and what has been done is but an index of what is yet to be done. In science the "impossible" is simply something that has not yet been made possible. Much that seemed impossible has been done by nineteenth century chemists, miners and metallurgists. There are existing unsolved problems in the mining and scientific world that will doubtless be solved in the twentieth century. Every such solution in the nineteenth has been productive of increased wealth and comfort and a better way of living. The man who works with hand or brain is everywhere better off to-day because of such scientific advance than were his predecessors a century ago.

And, after all, this is the great achievement, the one thing that will make this century memorable—that the spirit of scientific progress has banished the demon of fear which so long dominated the human mind; has multiplied the sources of human comfort and given the lowliest what monarchs of the preceding century could not enjoy. This scientific progress gives promise as certain as the morning sun of a coming noon of a prosperous human life to which this century was but the dawn.

Long ago science ceased to be content with tradition, and is recently successful in silencing old expressions of belief; hence science is a present vital force, believed in (because successful) by millions who formerly believed in finer forms of faith. Unlike the latter it never deceives or deserts its devotees, and its horizon constantly widens. The past is so narrow; the future grows broader and broader.

Concentrates.

ANNEALED silver is believed to be the best known conductor of electricity.

RICH ore and gangue once mixed can never be satisfactorily separated by sorting.

IN building the Chicago drainage canal 40% dynamite was delivered at 10½ cents per pound.

THE delivery of property to the agent who negotiates the purchases is delivery to his principal.

SULPHATE OF ZINC is always present in roasted zinc ore, ordinarily about one-half of one per cent.

A ½ H. P. engine and 12-inch propeller should propel a finely built 12-foot boat at an hourly speed of 5½ knots.

IN the absence of a specific agreement for compensation a partner is not entitled to be paid for his services.

MONO CO., Cal., was awarded the gold medal at the Columbian Exposition in '93 for the best marble exhibited there.

A WRITTEN order for merchandise that does not specify the time of payment is an agreement to pay cash on their delivery.

THERE is no law that requires a business man to put his name upon his place of business as a prerequisite to its full ownership by him.

THE General Land Office holds that an outstanding patent of the United States presupposes all legal requirements in obtaining the patent complied with.

COMMERCIAL tin is never pure. It will ordinarily analyze about as follows: Tin, 99.20%; lead, 0.39%; copper, 0.12%; iron, 0.08%; other elements, 0.21%.

JAVELLE WATER or solution of hypochlorites, with a preliminary application of dilute sulphuric acid, will obliterate ink writing without injury to the paper.

IT has been demonstrated by scientific experiment that there is proportionately more gold in the waters of Salt Lake, Utah, than in the waters of the Pacific ocean.

UNDERGROUND mining machinery and working methods do not seem to be the subject of such great and constant improvement as milling and surface appliances.

IN Swedish mines the blacksmiths who sharpen the drills are paid by the number of meters bored, and not by the number of drills sharpened, or by the day's work.

A DEAD black surface can be produced on either copper or brass by using ½ oz. platinum tetrachloride dissolved in 1 oz. of water. The metal surface must be chemically clean.

WHERE the diameter of a belting driven sheave is 24 inches and it is revolving 80 times per minute the 16-inch driven sheave will make 120 revolutions per minute.

THE best known method of preparing proof gold and proof silver appeared as an original article written by the assayer of the United States mint in the issue of July 16, 1898.

A TEST for gold in cyanide solution is to evaporate an assay ton of solution in a tray of lead foil, roll up tight when dry and scorify with test lead, cupel part and weigh the gold.

OXYGEN is an antidote for carbonic oxide poisoning, and a small cylinder of compressed oxygen could well be kept for such possible use wherever men are exposed to this noxious gas.

ARIZONA shows about as much metallurgical process as any mining region, more especially in the present economical and profitable handling of gold sulphurets and copper development.

THE exhaust of a gas engine can be made almost inaudible by connecting with an iron box or cylinder of three or four gallons capacity, with several diaphragms of ½-inch mesh wire cloth.

ALL government mineral lands in the United States are open to occupation and purchase by any citizen or by any one who has declared his intention to become a citizen of the United States.

THE Mount Morgan gold mine of Queensland has repeatedly been described fully and technically in these columns. Its maximum production was ten years ago—the 1889 yield being 258,950 oz. gold.

SCALE may be removed from drop forgings of iron or soft steel by using a solution made of (by volume) sulphuric acid, 1 part; nitric acid, 1 part; water, 2 parts, applied warm. Either the solution or the iron may be heated.

PLATINUM is twice as heavy as silver and nearly three times heavier than cast iron. It is almost as soft as copper and is as ductile as gold. It resists the strongest heat of the forge fire, but can be fused by an electric current.

FULLY two-thirds of the annual accidents to miners are preventable, and greatly so by training the miner to think and presenting the elementary principles of scientific mining—a part of the province and the purpose of this paper.

NEXT to osmium platinum is the heaviest natural body, its specific gravity being 21.5. It is the only metal that can be used to conduct electric current through the glass bulbs of incandescent electric lamps. It is softer than silver, does not oxidize, fuses at 3255° F., is usually found only in the metallic state, and of the six or seven tons annually mined nine-tenths comes from Russia, the most of the remainder from California.

TATTOO marks may be removed from the body (if it has been put on with carbonaceous matter) by being first well rubbed with a salve of pure acetic acid and lard, then with a solution of potash, and, finally, with hydrochloric acid.

AN 850-pound stamp, dropping 95 times per minute, requires 1.4 H. P. An ordinary concentrator requires about 1.25 H. P. Each stamp per hour requires from 65 to 75 gallons of water; each concentrator per hour from 180 to 275 gallons.

THE discovery of a vein in a tunnel, worked according to the laws of the United States, gives a right to the possession of the vein to the same length as if discovered from the surface, and a location on the surface is not essential to a continuance of that right.

PURE TUNGSTEN can be readily filed and forged, it welds easily, has no action upon a magnetic needle, and has a melting point higher than chromium or molybdenum. The pure metal is readily obtained by the reduction of tungstic acid with carbon in an electric furnace.

IT has long been known that gold can easily be induced to deposit from its mineral salt to the metallic state on any suitable base, such as iron sulphide. Thus, in non-gold bearing rock gold can be artificially introduced in interstices and on the face in such a manner as to seem a natural product—a sort of scientific "salting," so to speak.

AT any time prior to January 1st if a United States volunteer soldier filed with the County Clerk or Recorder in the county or district in which his mining claim is located a statement that he is in the service of the United States, no one can legally "jump" his claim, it being deemed by the Government that so far as his interest is concerned his assessment work is done.

"SEND me the best mining paper in the world for another year," is the terse comment of a Colorado mine superintendent with his renewal. "I get others free, but pay for yours, because it is the best," is the statement of a leading Montana mining engineer. "Yours is the only one that has the real mining flavor about it," is what an Arizona subscriber says.

AN immediate need of the California miner is an amendment to the State Constitution declaring mining a "public use," to the end that the owner of a mining claim may maintain proceedings in condemnation in order to run tunnels and secure other necessary rights of way. The State Legislature has tried to do this, but has been overruled by the State Supreme Court.

TO SUPPLY power for twenty-five days to a 1000 H. P. engine, requires: Good coal, 413 tons, having a volume of 14,800 cubic feet; compressed acetylene, 106 tons, having a volume of 9,890 cubic feet, or calcium carbide 295 tons, with a volume of 4,770 cubic feet. Calcium carbide is a concentrated form of fuel that when properly safeguarded will be of recognized economic value.

ANY one who has entered 160 acres of land as a homestead, and secured patent therefor, is thereafter debarred from taking another homestead, and any one who has entered 160 acres as a homestead and abandoned the same before making final proof, is thereafter debarred from making another entry, unless reasons for such abandonment, satisfactory to the department, are rendered.

AN unusually loud noise made by the exhaust pipe of a steam engine indicates the exhaust is not large enough, and that the escaping steam is exerting a wasteful back pressure against the piston. The resistance due to such back pressure so generated by a constriction of the exhaust may amount to four pounds on the square inch, sometimes occasioning a loss of power equal to 5%.

INKING rollers for printing presses that can be recast are made of the following proportionate materials: Best quality glue, 10½ lbs.; honey, 2½ gals.; purified India rubber dissolved in oil of turpentine, 1 lb.; Venice turpentine, 2 oz.; glycerine, 12 oz.; vinegar, 4 oz. Good rollers can be made of 2 lbs. glue and 1 gal. molasses, but they cannot be used over again, that is, recast.

"MINERAL WOOL" is made by blowing steam or air through melted iron slag. This slag is a sort of impure glass, and the "wool" is, therefore, a mass of fine threads of glass, interspersed, usually, with globules. Unless the material is carefully handled small particles will get under the finger nails or into the skin, causing irritation, and dust from it incautiously breathed may occasion hemorrhage.

AT 60 miles an hour the resistance of a train is four times as great as it is at 30 miles—that is, the fuel must be four times as great in the first case as it is in the other. But at sixty miles an hour this fuel must be exerted for a given distance in one-half the time that it is at thirty miles, so that the amount of power exerted and steam generated in a given period of time must be eight times as great at the faster speed.

IT has been decided by the Supreme Court of California—Altoona Quicksilver M. Co. vs. Integral Q. M. Co., 45 P. R., 1048—that under the Revised Statutes of the United States, Section 2342, providing that, when one holds and works a mining claim for the time prescribed by the statute of limitations for mining claims of the State in which it is situated, he may obtain a patent "in the absence of any adverse claim." Such possession and working for the statutory period, before the adverse right exists, is equivalent to a location under the acts of Congress.

REFINED petroleum is sometimes used with good effect in boilers to prevent scale forming material attaching itself to the boiler. It appears to rot the scale, causing it to form a soft mud, which can be blown out or washed out. Crude oil should never be used, as it gives off inflammable vapors and leaves a tarry residuum, which may form with the scale a tough greasy deposit on the plates over the fire and cause them to burn out.

EXCEPT in the top logs of a tree, or very small and young timber, the heart wood is, as a rule, not as strong as the material farther away from the heart. This becomes more generally apparent in practice in large sticks with considerable heart wood cut from old trees in which the heart has begun to decay or been wind shaken. Beams cut from such material frequently season check along middle of beam and fail by longitudinal shearing.

DURING the year '99 there have appeared in this paper 1131 illustrations—half-tones, wood cuts, zincos, etc., most of them original, many of them from photographs specially taken or drawings specially made for the purpose. It is believed that in point of number this amount of illustrations is unequaled by any similar journal anywhere in the specified time. As to their character and quality, the commendatory letters weekly received indicate their favor in the mining world.

URANIUM is used in the manufacture of gun metal, in producing an oxide imparting fluorescence to glass, and as a pigment in decorating china. As uraninite or pitchblende it occurs mostly associated with lead, silver, sulphur and arsenic; the pure mineral contains only the oxide of a golden yellow color. The metal itself is white, malleable, a little softer than steel, fuses at a cherry-red heat, and tarnishes slowly. It is found in paying quantities in Gilpin Co., Colorado.

GOLD COIN that has lost less than one-half of ten per cent by wear is received at any United States mint or depository at its full value; any gold piece light one-half of one per cent or more is received by weight only. United States assay offices advance 90% on the gold left there, and when the actual value is determined settles by check on the treasury. American, French and German gold coin is nine-tenths fine, British eleven-twelfths. All settlements are made on the basis of "fine gold."

A LODE may be defined as a zone, belt or body of quartz or other rock lodged in the earth's crust, and presenting two essential and inherent characteristics, viz.: 1. It must be held in place within or by the adjoining rock; and, 2, it must be impregnated with some of the minerals or valuable deposits of which cognizance is taken in the Federal statutes applicable thereto. The finding of such a lode is a discovery within the meaning of those statutes, and will authorize the location of a lode claim.

ROSSLAND, B. C., ores are chiefly pyrrhotite, with a diorite gangue, and sometimes pyrites, marcasite, chalcopyrite, mispickel, magnetite, with quartz and calcspar intermixed. The ore for assay is crushed to pass through a 100-mesh sieve, and a flux used made of 6 lb. soda bicarb., 4 lb. litharge, 2 lb. borax glass, or 6 lb. soda bicarb., 4 lb. 13 oz. litharge, 3 lb. powdered borax. A 20-gramme crucible is used, and for an assay half an assay ton of ore and two assay tons of the mixture, adding nitre and silica when necessary.

PARTINIUM is the latest alloy, being aluminum alloyed with tungsten. The resultant metal is claimed to have a specific gravity of 2.89 cast and 3.09 rolled; the elongation varies from 6% to 8%; its tensile strength is given as from 45,500 to 52,600 pounds per square inch. Dr. Mach reports an alloy of aluminum with magnesium. A 10% magnesium alloy resembles zinc, a 15% brass, and a 25% a compound bronze. It is stated that this alloy can be soldered, makes good castings and will resist the action of the atmosphere. It can be worked as well as brass, and is even lighter than aluminum.

ON the last four pages of this issue appears an index of the contents of this paper for the preceding volume of six months of 772 pages. The value of such an index is sufficiently manifest to need no notice, but it is referred to because of its time-saving property. The editorial office is in constant receipt of requests for articles on some particular subject of mining or metallurgy that appeared at some date indefinitely designated. It would save time if the questioner had the index for reference. Thousands of our readers annually or semi-annually have their volumes bound, but thousands more do not, and it is the latter class of readers who are urged to preserve their papers and have them bound. In no way can a cheaper or more valuable compendium be secured of everything that any one connected in any way with mining and metallurgy wants to know. The paper for the year 1899 contains 1460 pages—sent postpaid, weekly, for $3—and its contents are of constant value. The attention of those who may have overlooked this important matter is respectfully directed to the scope and character of the contents of this paper as shown in the index on pages 769, 770, 771 and 772 of this issue. And those who are not regular readers are also respectfully informed that for $3 they can receive weekly, postpaid, fifty-two numbers of this paper, with just twice the amount of valuable data as is indexed for this Volume LXXIX, the last half of the fifty-two issues of 1899.

The Cripple Creek Gold Fields.

NUMBER III.

Written by T. A. RICKARD, State Geologist of Colorado.

THE TREATMENT OF THE ORES.—Most of the gold of commerce has been won from simple ores, those in which the precious metal occurs in a native condition encased in quartz. Stamp milling, accompanied by amalgamation, is the process ordinarily employed to reduce them. Another type, of greater importance every year, is represented by the ores in which the gold occurs intimately associated with iron pyrites, but so minutely disseminated as to be rarely visible even under the microscope, and therefore inviting the supposition that it is chemically combined in a condition as yet not understood. A modified form of stamp milling is employed for some of these ores, but for the most part they afford a field for great diversity of practise, including chemical and smelting processes of many kinds. The third type of gold mining, and in many respects it is the most modern, is represented by ores in which the gold is known to be chemically combined in definite proportions with the element tellurium. Several mining regions produce these telluride ores. Transylvania in Europe, Colorado in the United States, and West Australia in the Antipodes are the principal localities. The new phases of metallurgical practise inaugurated by the recent discoveries of telluride ores have given a great impetus to this technical science, the aid of which is now thoroughly appreciated by the miner and capitalist alike.

The changes which have occurred since 1891 in the treatment of the ores produced by the mines of Cripple Creek are a fitting illustration of the fact that the development of metallurgical practice, like all true progress, is a slow evolution from simple beginnings to a full fruition. The chlorination process was first applied in 1857 by Deetkin in California. It took a quarter of a century of patient endeavor to place it on a safe commercial basis. McArthur and Forrest's application of potassium cyanide was used at the Crown mine in New Zealand as early as 1889, but the chemical reactions which occur in the cyanide process are still incompletely understood to-day, and the development of this method of ore treatment cannot be said to have ceased.

The first ore broken at Cripple Creek was carried on the backs of prospectors to Colorado Springs or Florissant, and forwarded to the smelters of Pueblo and Denver. Subsequently larger lots in wagons were similarly consigned, but the costs were high and the proportion of ore capable of yielding a profit under such conditions was small. The miner felt the necessity of extracting the gold by milling it nearer the place whence it came. He fell back on his previous experience in other localities and put up a stamp mill.

The stamp mills were built on the model of those of Gilpin county, the oldest gold mining district in Colorado, and therefore had light stamps, 400 to 500 pounds; a slow drop, 30 to 35 per minute; a long drop, 17 to 20 inches; and a deep discharge, 12 to 15 inches. The ore was broken by hammers and fed by hand into the batteries, except in the case of the Rosebud mill, which was provided with rock breakers and automatic feeders. Amalgamation, on copper plates, both inside and outside of the mortars, followed the stamping.

Ten mills, with a total of 270 stamps, were built. In April, 1897, only 50 out of this number were dropping, and to-day all are idle, having been replaced by large leaching plants.

The first ores came of course from the surface, or near it, and were oxidized. The gold occurred in a free state, having been liberated from its combination as a telluride. It affected the milling seriously, because gold having this origin is coated with a film of the telluride of iron, which is a serious obstacle to amalgamation. The extraction in the stamp mills was soon found to be low, and attempts were made to remedy the incompleteness of the treatment by employing bumping tables and Frue vanners to arrest the gold escaping amid the tailings. When this failed blankets were added, and these in time became a recognized addition to the mills. Even then the best extraction barely reached 50 per cent of the gold in the ore, as shown by assays, and a great deal of good ore was wasted in an ineffectual effort to win a profit. The usual rate for treatment was $3 per ton, delivered at the mill.

Early in the development of the district there came men who recognized the unsuitability of stamp milling for the treatment of telluride ores, and in 1893 W. S. Morse of the Russell Lixiviation Works, at Aspen, made the experiments which formed a basis for the erection of a chlorination plant built by Edward Holden, at Lawrence, two miles from the town of Cripple Creek, at the close of the same year, 1893. Holden purchased an old stamp mill at Lawrence and altered it to a chlorination plant, which, although it was crude and incomplete, successfully demonstrated the suitability of the process employed. This was barrel chlorination on the model of the practise of South Carolina and Dakota. The first well-designed plant, using this process, was completed in January, 1895, and had a capacity of fifty tons per day.

The cyanide process had been already tried, with results not wholly satisfactory, because of the variable composition of the ores and the inexperience of the men who organized the first milling enterprise. The local company built a cyanide mill of forty tons capacity at Brodie, in 1892. It was remodeled in 1894. In 1895 the Metallic Extraction Co.'s mill was built near Florence. It has been enlarged from time to time and now has a capacity of 8000 tons per month. The cyanide process made less progress than barrel chlorination, so that while two mills now employ this method, six use the other. The Colorado-Philadelphia chlorination mill was built at Colorado City in 1896. It has a capacity of 6000 tons per month. The El Paso mill, with a capacity of 3000 tons per month, was built at Florence in 1897. The Gillett mill doubled its capacity in 1898.

THE MILLS OF THE CRIPPLE CREEK DISTRICT.

Name.	*Location.*	*Date of Erection.*	*Capacity per day. Tons.*
Chlorination—			
Lawrence	Cripple Creek	1893	30
Gillett	Gillett	1894	80
Colorado-Philadelphia	Colorado City	1896	200
El Paso	Florence	1897	100
Colorado	Arequa	1897	75
Kilton	Florence	1897	50
Cyanidation—			
Brodie	Cripple Creek	1892	60
Metallic Extraction	Florence	1895	270
Page	Florence	1896	20

The Lawrence mill was burnt down in 1896, and the owners of it built the El Paso, at Florence, immediately afterward.

The trend of events indicates that the future growth of the milling practise will favor an increase in the chlorination mills rather than in cyanide establishments. At first, cyanidation was conducted upon raw ores, but this gave good results only when they were oxidized. Roasting is now considered a necessary preliminary, and it has removed the advantage which in the earlier years of the district cyanidation possessed over chlorination, a process always preceded by the roasting of the material subjected to it.

The chlorination practise of the district has undergone no radical changes during recent years. It is typical barrel chlorination. In the matter of the recovery of the gold from solution there is a difference, the Gillett mill, for instance, using charcoal as a precipitant, while the Colorado-Philadelphia plant uses sulphuretted hydrogen. The mills at Florence enjoy an important advantage in the use of oil residuum instead of coal in their roasting furnaces. The residuum comes from the distillation of petroleum and costs about $1 per barrel now, although a few years ago the price was much less. There is an increased demand for it because it affords a fuel peculiarly adapted for roasting, permitting of a nice and quick adjustment of the temperature of the furnace.

During recent years the metallurgical practice in the chlorination plants has remained fairly constant, the improvements being in the direction of large capacity and better mechanical arrangements rather than in any changes in the chemical department.

The cost of treatment at one of the larger mills, having a capacity of 3000 tons per month, is, per ton of ore treated:

Labor and salaries	$1.20
Chemicals and supplies	0.78
Fuel	0 65
Wear and tear	0.55
Incidentals	0.28
	$3 46

Add to this interest on investment, general expenses and deterioration of plant, and the total costs will approximate $4 per ton. The above figures are based on chloride of lime costing $2.40, and sulphuric acid $1.25 per 100 pounds. Roasting alone costs from 45 to 60 cents per ton. This item has grown as the mines have become deeper, the sulphur contents having increased from an average of 1 per cent in 1895 to 2½ per cent at the present time. The improvements in other departments of the milling have more than balanced this change.

Two interesting features of Colorado practise have been brought out by the treatment of the Cripple Creek ores, the first being the greater use of mechanical roasters, such as the Pearce, Ropp, and other furnaces; and, secondly, a modification of the methods employed to sample the ores. The material produced by the mines is, as compared with the typical ores of other districts, high grade and variable in its gold contents. This variability is due to its mode of occurrence as a telluride in minute seams irregularly scattered, and, of course, extremely rich, rendering it difficult to apply the law of averages and obtain a satisfactory sample of a large lot of ore. In its passage from the hands of the miner to those of the smelter, the ore usually goes through the sampling works, the owner of which may be considered a broker whose business it is to see that both parties in the transaction get those values in the ore which one sells and the other buys. It was soon found that Cripple Creek ores were most unsatisfactory to sample, the results being unreliable and erratic. This became remedied in process of time by crushing a larger part of any particular lot of ore and taking the pains to pulverize the final pulp sent to the assayer to 100 mesh (that is, 10,000 holes per square inch), instead of 60 or 80 mesh. It has been found that, on account of the variability of the ore, it is good business for the mine owner to let all his product pass through the sampler on its way to the smelter, and this has led to the erection of half a dozen sampling works in the Cripple Creek district. The usual cost of sampling is 75 cents per ton.

(TO BE CONTINUED.)

Electroplated Steamships.

The Navy Department has received a full report showing the record of the American steam tug Assistance, which for four years has been used as an experiment in electroplating with copper as a method of protecting iron ships' bottoms, says the Journal of the Franklin Institute. The iron plates of this vessel were covered by a thin copper coating applied by means of electricity. The Assistance, after being electroplated, was launched in Jersey City on February 22, 1895, and from that time until a few days ago, she was constantly in the water, and no attempt was made to clean her bottom. Upon being hauled out of the water at the Norfolk Navy Yard the craft was found to be remarkably clean. The bottom was entirely free from barnacles or marine growth of any kind. For the year just past she has been towing in the lower waters of the Chesapeake, and while other tug boats made it a practise to haul out to clean bottoms every four weeks the Assistance remained constantly at work.

As a result of the successful outcome of the Assistance test, it is thought to be quite probable that the Navy Department will order the electroplating of the bottoms of the new warships now building. The electroplating process can be carried out on the plates before they are fitted to the frames. In this process the copper is, figuratively speaking, fused into the steel plates to a depth of about 1-32 of an inch. The time required to treat a plate is about forty-eight hours.

The cost of applying the copper in this manner is said to be about $3 per square foot. The cost of the method of sheathing now commonly used is about $5 per square foot. By sheathing is meant the English system of planking the outer skin of an iron or steel vessel, countersinking the boltheads, and then fastening the copper plates to the wooden planking after the manner followed on wooden ships. If the copper plates were applied directly to the skin of an iron or steel vessel galvanic action would result, hence the necessity of the interlayer of wood. The disadvantages attending sheathing are the increased weight of the hull and the disturbance of a vessel's speed lines.

For a vessel 250 feet long there would be required about twenty tons of copper, by the electric process. If covered by the old style sheathing of wood and copper the added weight is more than 100 tons. It has even been found that the use of wooden sheathing between the iron plating and the copper sheathing forms a galvanic pile, as the wood in time becomes water-logged, thus establishing a current between the copper and the iron.

If the process develops no unexpected drawbacks, the value of this comparatively simple method of overcoming one of the most serious difficulties in iron and steel vessels, can hardly be overestimated. It is claimed that as much as $20,000 is yearly expended by various ships in the transatlantic trade as the result of overcoming the added friction caused by fouling. To dock one of the big ships of several well-known lines only twice a year, at $7,500, would bring the total loss per craft up to $35.000 as a yearly penalty for unprotected bottoms. The frictional contact of water against copper is considerably less than against iron, as a painted surface can never be made as smooth as a burnished copper surface. An iron vessel with a speed of twenty knots per hour, if coated with copper, would have, it is calculated, a speed of twenty-one knots per hour.

IN the Carclaze mine, near St. Austell, the granite is traversed by thin strings of quartz and schorl, which carry tinstone. They strike in all directions. The upper portion of the deposit was greatly weathered and decomposed, but as it was quarried away it became harder. It is a typical stockwork, and the strings of quartz and schorl seem to have been formed almost contemporaneously with the granite. Formations resembling this are found in other parts of Cornwall. Near Bodmin the granite is traversed by small stringers, which vary from mere threads to a width of 2 or 3 inches. They are rarely more than a couple of feet apart, and many preserve independent courses for considerable distances; but sometimes they branch out in various directions, or intersect and form floors and lenses. In the Carrigan mine a dyke of greisen 150 feet wide occurs, and is intersected by a network of quartz and schorl strings carrying iron, copper, arsenical pyrites, fluorspar, and about a quarter per cent of cassiterite per ton.

Laccolites and Their Relation to Ore Deposits.

Written for the MINING AND SCIENTIFIC PRESS.

One of the most interesting features in geology is the occurrence of sheets of intrusive, eruptive rock intercalated with the strata of sedimentary beds. In most cases these igneous masses were ejected from below as a central mass or core, breaking through underlying old crystalline formations, reaching overlying, non-conformable, horizontally-disposed sedimentary beds, and uplifting them en masse in the form of a dome, the eruptive material being ejected between the sedimentary rocks and the underlying crystalline terrane. Often such uplift of the sediments causes fractures at one or more places in the roof of this dome-like structure and the molten magma ascends to higher levels, crushing, upturning and tearing the rocks and sending out sheet after sheet from the uncleal mass into the parted sedimentary beds.

In another instance the intrusive rock may not disturb the sedimentary rocks at their point of contact with the older underlying formation, but burst through to a higher horizon and send out the first sheet between the strata of the sedimentary beds where they part most readily, and often this occurs between two rocks of unlike character, as limestone and quarzite. Fig. 1 represents this occurrence.

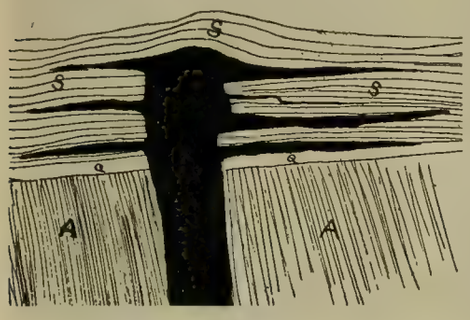

Fig. 1.—A Sheeted Laccolite.

A.—Algonkian. Q.—Quartzite. S.—Sandstone.

A third phase of the occurrence of these peculiar intrusions of eruptive rock is their accumulation between the parted beds of the sedimentary formation in the form of a great dome-shaped mass sending out no flat sheets, though sometimes small dykes are thrust upward into the fissures formed in the overlying strata by their uplift and consequent tension. See Fig. 2.

These intrusions of molten magma are called laccolites, of which the latter is the typical illustration, and they form a prominent and important feature of the geology of portions of the Rocky Mountain system.

Fig. 2.—Typical Laccolite.

Attention was called to this form of eruptive intrusion by G. K. Gilbert in his monograph on the Henry mountains of Utah, published in 1877.* Gilbert's explanation of the facts as he observed them in the Henry Mountains is that "in a region of extensive sedimentary beds lying horizontally molten magma ascended from great depths to various horizons in the complex of strata, where they spread out as sheets or in larger dome-shaped masses, more or less pronounced, lifting up the load of sediment above them. By expansion or stretching the sediments remain unbroken above these laccolites, while in other cases a rupturing of certain beds took place and the fissures were filled with magmas, forming dykes, usually of limited extent."

In the first observation in a field in which a laccolite has performed an important part in the geological structure the observer may reach the erroneous conclusion that certain sheets of igneous rock were the result of overflow from a volcanic outburst (though failing to find the crater) and that the sheets were contemporaneous in origin with the laying down of the strata. That such a condition may exist cannot be disputed, but where such occurrences are found in the Rocky Mountain region and as far west as the Great Basin it is fairly safe to assume that the intercalated sheets owe their existence to a laccolitic intrusion.

Erosion usually has greatly modified the topography of the country after the injection of the laccolite and only remnants of it may exist. The co-extensiveness of sheets may be interrupted by the erosion of canyons and the uncleal mass may lie buried deep beneath the overlying sediments of a mountain.

Laccolites are of many sizes, some being relatively small, the central mass being but a few feet in extent while the sheets penetrate but a few hundred feet from the central core. Others are of vast magnitude, the uncleal mass constituting a great mountain, and the horizontal sheets radiating from it reaching many miles on all sides.

Some of the important localities in which laccolites occur beside the Henry mountains are the following: The West Elk mountains in Colorado, of which Mt. Marcellina is an important example, though isolated from the main Elk mountain range; Mt. Wheatstone, Mt. Axtell and the Anthracite range are also included in the laccolitic mountains of the range; Crested Butte is the most easterly of the West Elk group, and is a typical laccolite, as is also Gothic mountain. Seventy miles southwest of the West Elk group are the San Miguel mountains, also in Colorado, and these include a group of laccolitic uplifts. Twenty-five miles further south the La Plata mountains forms another group of similar geological interest. Ute Peak, in El Late mountain, is a laccolite.

In Utah, close to the Colorado line, are the La Sal mountains, to which attention has recently been drawn by reason of important copper discoveries. The group comprises some thirty peaks, the summits of which range from 11,800 to 13,000 feet altitude. They constitute an isolated group in the high plateau country. In this group no laccolites appear on the exposed slopes of the canyons, but it is the belief of geologists that the uplift is due to the presence of laccolitic intrusions at greater depth. The Mosquito range in Colorado lies between South Park and the upper portion of the Arkansas Valley. In this region are the mining districts of Leadville and Ten Mile, and in this section laccolites are important factors in the geology of the region, as also at Aspen in Pitkin county.

In the Black Hills of South Dakota, in Lawrence county, are found numerous laccolites, the largest and most important being that of Terry Peak, the dominant mountain of the northern hills. Many small laccolites occur in this region to which reference will be made later.

In Montana, in the Yellowstone Park and in the Little Belt mountains, are occurrences which have been referred by United States Geologists J. P. Iddings and Waldemar Lindgren to laccolitic uplift.

In addition to the several instances cited are numerous others which may or may not be of true laccolitic type, they not having been determined owing to lack of sufficient exposure or in some cases to lack of careful study. Spanish Peaks, Colo., are supposed to be of laccolitic origin, but this has not been positively determined.

There are other forms of intrusive uplift which do not assume the distinctive laccolitic type. In the Black Hills region in South Dakota and Wyoming are found a number of these postular outbursts, the character of which indicates that while possessing sufficient force to raise the overlying sedimentary beds—several thousand feet in thickness—they did not assume the laccolitic type by reason of lack of force, or possibly the fluidity of the magma and the duration of the period of uplift and injection did not favor it. At all events these intrusive masses now form prominent landmarks at various points on three sides of the Black Hills, being separated from the hills proper by several miles of plain or low-lying foothills. The most important of these are Bare Butte, a few miles northeast of Sturgis City; Crow Peak, six miles west of Spearfish; The Devil's Tower on Belle Fourche river, northwest of the Hills; Sundance mountain and Inyan-Kara mountain on the western side of the Hills in Wyoming.

The geological occurrence of each of these is essentially similar, consisting of rudely circular or oblong, intrusive mass of eruptive rock of trachytic character thrust upward beneath the sedimentary beds of the Cambrian, Carboniferous and Jura-Trias. Crow peak is nearest the Hills and here are found the Cambrian quartzites and sandstones and Carboniferous limestones reared upon the shoulders of a great mass of trachytic rock. This occurrence is illustrated by Fig. 3. The other peaks lie at greater, though varying distances from the Hills, and the paleozoic rocks are not exposed, but the series overlying them—the Jura-Trias and Cretaceous rocks are found encircling the volcanic uplift from which the sedimentary beds dip away on all sides toward the surrounding plains. The most remarkable in appearance of these several hills is the Devil's Tower. It stands back about two miles from the Belle Fourche river on a comparatively level table land. The eruptive neck rises with nearly vertical sides 800 feet above the plain, is nearly circular in form and is striated from top to bottom by the columnar structure assumed by the rock—sanidim-trachyte. The sedimentary beds (Jurassic) through which it has broken are but slightly uplifted and the weathering of the mass of eruptive rock has resulted in the accumulation of a deep talus about its base. From a distance it greatly resembles the stump of a huge tree. Bare Butte, near Sturgis, viewed from the eastward, has the shape

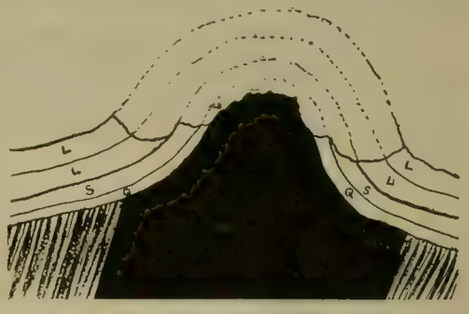

Fig. 3.—A Postular Uplift.

Q.—Quartzite. S.—Sandstone. L.—Limestone.

of a haystack and may be seen over a hundred miles, and few who for the first time have seen this odd hill, approaching from the direction of Pierre, have not mistaken it for a haystack on a neighboring ridge, though 100 miles distant.

Inyan-Kara peak is similar to Bare Butte, but the central eruptive core has lifted the sediments evenly on all sides and erosion has resulted in cutting out a circular valley around the core, between it and the harder rocks of the sedimentary beds lying upon its flanks. In form it resembles a cinder cone within the crater of a volcano. A crevasse eroded on one side of the sedimentary uplift affords drainage to the circular valley.

It has been recently reported that valuable mineral deposits have been discovered on Inyan-Kara Peak, but the report lacks confirmation.

From the above description the distinct difference between these postular uplifts and the true laccolite will be readily understood. Undoubtedly the former, like the laccolites, were erupted prior to the erosion which has swept away the Tertiary, Cretaceous and earlier formations down to the Carboniferous. There is no evidence that the eruptive material ever reached the surface and outpoured upon it. Indeed, such evidence as can now be studied tends to the belief that the eruption was wholly subterranean, and that the sedimentary rocks extended over the uplift in the form of a quaquaversal fold. It seems reasonable to assume that these uplifts resulted in a greater or less fracturing of the rocks forming the summits of the domes, and that as a consequence they have been eroded, exposing the uncleal cores and the sedimentary beds upturned about them. W. H. S.

World's Production of Gold and Silver.

The report just issued by the Director of the French Mint contains some important facts on the coining of gold and silver, reports John C. Covert, United States Consul. The production of monetary units in the Mint of France has been steadily increasing for a number of years. In 1894, the number of pieces of money coined for France, her colonies, and foreign countries was 46,000,000; in 1895, 54,000,000; in 1896, 62,000,000; in 1897, 111,000,000; and in 1898, 98,000,000. The Mint can double this output. Russia alone has had 82,000,000 coins struck in France since 1896. The French Mint has also done work during the past two years for Indo-China, Tunis, Ethiopia, Morocco and Bolivia.

The quantity of gold produced during the last fifteen years is placed at 13,000,000,000 francs, or, in round numbers, $2,500,000,000, of which amount the Transvaal is credited with a production of 2,000,000,000 francs ($386,000,000). It is believed that not less than 200,000 pounds have been used in the arts. The weight of gold struck annually into coins varies between 660,000 and 1,320,000 pounds. The quantity recoined is to be added to this. But in spite of the increase in the output, a well-known economic writer declares that the war in the Transvaal will cause a scarcity of the metal in many commercial centers, the result being a great falling off in the quantity used in the arts.

The report notes a constant increase in the output of silver. The writer just quoted, in speaking of this, says:

"No one can see where the masses of silver are going which continue to pour out upon the world, or where they are to be used. The old 15½ standard is now but a myth, and the price has fallen from 220 francs for 1 kilogram ($42.46 per 2.2046 pounds) of fine silver to 100 francs ($19.30). In the presence of such a decrease in price, one would expect a diminution in production; but the case is just the reverse. The fact that the yield steadily increases proves that prevailing rates are remunerative."

The production of silver has risen from 3,000 tons

in 1888 to 6,000 tons in 1898. Of this, it is estimated that 2,250,000 pounds are absorbed in the arts and general industry, divided among countries as follows: In the United States, 580,000 pounds; in France, 330,000 pounds; the same in Germany and England; in Russia, 210,000 pounds; and in Austria-Hungary, 115,000 pounds.

It is asserted in the French economic journals that cargoes of silver go to the Orient every year, where it is in all probability hoarded in ingots, the Mints of Calcutta and Bombay being closed to it. Specialists estimate the amount thus disposed of at about 2,250,000 pounds. The calculations leave 2,100,000 pounds to be accounted for.

The Petrified Forests of Arizona.

The petrified forest of Arizona has in the past few years attracted much attention from geologists and others interested in kindred phenomena of nature, says the Flagstaff Sun.

There are several thousand acres of this forest scattered over the sand deserts of northern Arizona, in the vicinity of Holbrook. In the last year the railroad company has established a station called Adamana, and from that place the traveler can reach the wonderland by a six-mile drive, though the greater part of the forest is twelve miles to the south of the station.

At what is known as the first deposit several sections of land are covered with the fallen trunks of the trees, checked and broken, and up on a bluff of clay, 100 feet or more from the valley below, is the petrified tree forming a natural bridge across from one edge of the bluff to another 50 feet in length. The earth has gradually washed away from beneath its center, leaving both ends resting upon a sandstone formation. Its trunk and one end may be followed for some distance with the eye until it is completely covered by the earth. Near the west end the great log is cracked all the way through, only its weight keeping it in place. A cowboy recently rode his pony across the bridge and the weight did not affect it in the least. It is one of the most perfect and the largest sound log in the forest, being over 5 feet through at the butt.

Most visitors are taken to this forest only and do not see the larger forests to the south, which have been uncovered by erosion. The greater part of the wood at the first deposit is badly shattered and in small pieces of a dull red color.

At the second deposit to the southeast are found many large trees in a better state of preservation, having apparently been more recently exposed to the elements. They are broken into sections of from 5 to 6 feet in length and not so completely shattered as at the first deposit. There are several hundred acres in this deposit, though pieces of petrified wood may be found for a distance of 200 miles east and west, all apparently being a part of the same forest, but not all exposed as are the three deposits.

The third deposit is the largest of them all. It is mainly in the bottom of a canyon several miles in width; here are thousands upon thousands of the agatized trees lying half buried in the sands, exposing untold beauties to the eye of the traveler. Bright pieces are scattered in all directions exhibiting all the colors of the rainbow; pearly crystals, some pink, others white or delicate blue, gleaming in the sunlight from the hearts of old trees that have laid beneath the earth for years; other broken sections of huge trunks show beautiful combinations of colors, including red, green, velvety reds, pinks, pearly white, dark blues, yellow streaks circling the entire trunk; the bark is still perfect, making a delicate framework for the blended colors within.

You may walk in places for 100 yards upon the trunks of the trees. The limbs seem to have been either rotted or washed away before petrifaction, as but few of them can be found. Only the largest and most hardy remain to tell the story of long ago. The entire country surrounding has the appearance of having been at one time the bottom of a large body of water, for petrified bones and shells are found in great numbers here; in places the trunks of trees may be seen protruding from the broken banks of clay 20 feet under earth and beneath a ledge of sandstone.

The canyons surrounding them are called the "bad lands," as they are in truth. Not a vestige of herbage grows upon these hills that form the sidewalls of the great park. They are a dull grayish color, and are washed round at the top with great gullies and seams cut through their sides. On the top of many of them are large boulders clinging to a slender foundation of earth underneath; others standing like the Egyptian Sphinx, with their narrow neck and bulging domes, saved from being toppled over into the canyon below by the protecting pillar of earth beneath. The rim of the mesa surrounding them has washed away and great rocks have tumbled down in profusion all along its sides.

The large trees are broken in most instances in blocks from 2 to 3 feet in length and as round as a grindstone, and look as if sawed into lengths for stove wood. The wood greatly resembles the pine here, with some few trees of a dull gray color that are taken to be cottonwood or aspen. Pieces are found partially petrified, but these lack the colors of pieces thoroughly petrified, and are dark and charred as if partly burned.

Utilizing Coal Waste.

All over this country wherever hard or soft coal is needed are great heaps of waste. They contain possible wealth, just as mine tailings contain values when properly treated. Numerous attempts have been made to put the coal dust in those waste heaps in shape to burn, and in some cases a degree of success has been reached. A California company has successfully experimented in San Francisco and Los Angeles, and has produced little chunks of compressed coal that burn readily. For sixty years efforts have been made to produce a "briquette" in every way satisfactory, and over a hundred patents have been taken out. The fuel question is universally an important one, and though in the soft coal regions coal can be mined and delivered for $2 per ton, yet for steam purposes competitive manufacture requires fuel at a much lower figure. In Europe the briquette manufacture is a great industry, especially in France, Belgium and Germany. About 20,000,000 tons were made in 1898. The copper smelting works of the Boleo Company, Santa Rosalia, Lower California, are supplied with fuel by German made briquettes. In this case bitumen is used as a binder, occasioning smoke and dirt. An American company is making briquettes at Chicago under the Corning patent, and claim to be able to furnish these little oval balls of compressed coal, smokeless and readily combustible, at a price that should insure their general use as a cleanly and economical proposition. This week a small box of them received by express from New York city was used for fuel in this office. The briquettes burned readily, with little ash, and appear to be excellent fuel in every way. They are made of 93 per cent anthracite and bituminous coal, 7 per cent binder. They weigh 5½ ounces each, there being 5840 in a ton. They retail for $4.50 per ton in Chicago. At that figure there ought to be money in it for the manufacturing company and a great saving for consumers. Millions of tons of this coal waste can be bought at the mines for 10 cents per ton in Pennsylvania, Ohio and Illinois. Wherever heat is required, whether for steam, cooking or warmth, there is a tremendous daily demand for a cheap fuel free from fumes. This demand would seem to be supplied by the Chicago Briquette Coal Company. The accompanying illustrations give graphic idea of the manner of manufacture and use. The subject is one of considerable economic interest.

Crushing Machine—For Breaking "Run-of-Mine" Coal.

Mixing and Weighing Room

A Theory of the Genesis of Ore Deposits.

TO THE EDITOR:—In these days, when the United States Geological Survey is gathering and compiling such a mass of valuable information concerning the rocks and mineral resources of the United States, it seems a pity, from a prospector's point of view, that there is no rational system of geological nomenclature in use. It would help to avoid a great deal of confusion if a system of geological names after the plan of modern chemical nomenclature could be devised and adopted, for with a few years more of such progress as geologists have been making recently it will be desirable that geological writers include with each paper a glossary of the terms used therein, according to their understanding. If the science is to be of any value to the nation at large its value must lie in enabling men to calculate, more or less correctly, as to character and constituents of underlying formations. To obtain the best results the science should be stated in such form and terms that men of fair intellect and an average education would be able to understand, after a few weeks of study, a scientific description of the formation in their own neighborhood, at least.

A classification of rocks according to the mode of their formation and the source whence their materials were derived would also be of value to well-informed prospectors. To the gold hunter of the present day it is a small matter whether a certain area of slate and schist was formed in the Cambrian or the Cretaceous age; but a more important question is, Was it made from glacial mud, river silt, decomposed pumice, or otherwise?

Other problems of far greater importance are: What is the cause of volcanic action? Whence is the force derived, and how applied to produce such varied effects as the mountains bear witness of? For it is only by a correct solution of these problems that we may hope to explain the genesis of metalliferous veins and deposits, as these, with exception of the sediments, are invariably closely connected with the records of eruptive action or allied movement. Flowing springs of water are frequently found on or near the summits of high mountains, much higher than any probable source of water supply. What keeps them flowing? Not having been able to find a satisfactory solution in print, I would suggest a line of investigation to such as are in a position to study the matter, faintly hoping that it may lead to a fair understanding of the subject in due time.

The force called gravitation is directly and indirectly the cause of all geologic phenomena of the earth; the sun and moon being the engines of construction and destruction of the rocks, water being the implement through which the force is mainly applied.

Recent press reports give an account of a movement taking place along a fault plane in Butte City, Mont., whereby walls were cracked and buildings wrenched, which serves to show that such movement is possible at any time, though not frequently observed.

Every miner is familiar with the polished and striated faces of fault planes and sheared zones in the rocks of nearly all mines, where the rock has been crushed and moved in a manner that must have been accompanied by great friction and much consequent heat, and it is on such record that this theory of igneous action is based.

Given a fault plane where such movement is frequent or constant, it follows that heat will be generated, and if water is present it will be expanded, and hence will rise along the easiest outlet, being replaced by cooler water, thus producing a flowing spring at the outcrop of the fault plane or fissure, unless there be some other outlet offering less resistance. Such springs may be classed as the quiet stage of volcanic action, which, if the water supply is sufficient, may continue with variations for ages, with little geologic effect. If the movement be greater or the water supply insufficient, the heat must be absorbed by the contiguous rocks until the local pressure due to expansion is so great as to disturb the surrounding strata, forming new faults and fissures attended by earthquakes. Such might be called the vibratory phase. If for any reason the circulation of water is prevented while heat is being generated in such a fault plane, then vaporization of the water present may be effected, until the pressure may become so great as to overcome the strength and weight of the superincumbent rock, when an explosion must result, producing a crater, with eruption of fragmentary rock.

An active movement of an open fault plane with fair supply of water must pulverize the rock between the walls, producing a mass of mud and breccia which may or may not be ejected at the surface as the expansive force of both solids and vapors must depend on a variety of conditions and give various results.

If water be in excess the ejection may be hot mineral water, or it may be like the slimes of a quartz mill and leave a deposit on the surface such as is abundant in volcanic regions. Again, there may be only sufficient water present to prevent complete fusion of the rock before the ejection of the same is forced by expansion of the vapor. Or again, the seat of action may be at such depth that by reason of the pressure complete fusion of the rock may be effected before the expansive force of the included gases becomes such as to eject the overlying matter, and thus an active volcano, boiling constantly, but ejecting lava at irregular periods, is supported; presenting all the phenomena of an inverted reduction furnace on a grand scale. The solid rocks of the fissure walls are broken under such pressure that the frictional heat produced is sufficient to melt them completely and vaporize their volatile materials.

As the depth of an active lava-producing volcano may be reckoned as 30,000 to 70,000 feet, the water contained naturally in the rock is unable to expand very greatly, even though the heat be sufficient to decompose it; yet, as it is inherently much lighter than other minerals, it will rise, thus assisting circulation in the molten mass, carrying up the lighter and less fluid portions of the lava to be ejected first, and permitting the heavier and more liquid parts to settle toward the bottom of the fissure.

It is probably by reason of such action continued throughout the ages that while astronomers reckon the specific gravity of the earth at about 6, mineralogists find that the surface averages less than 3.

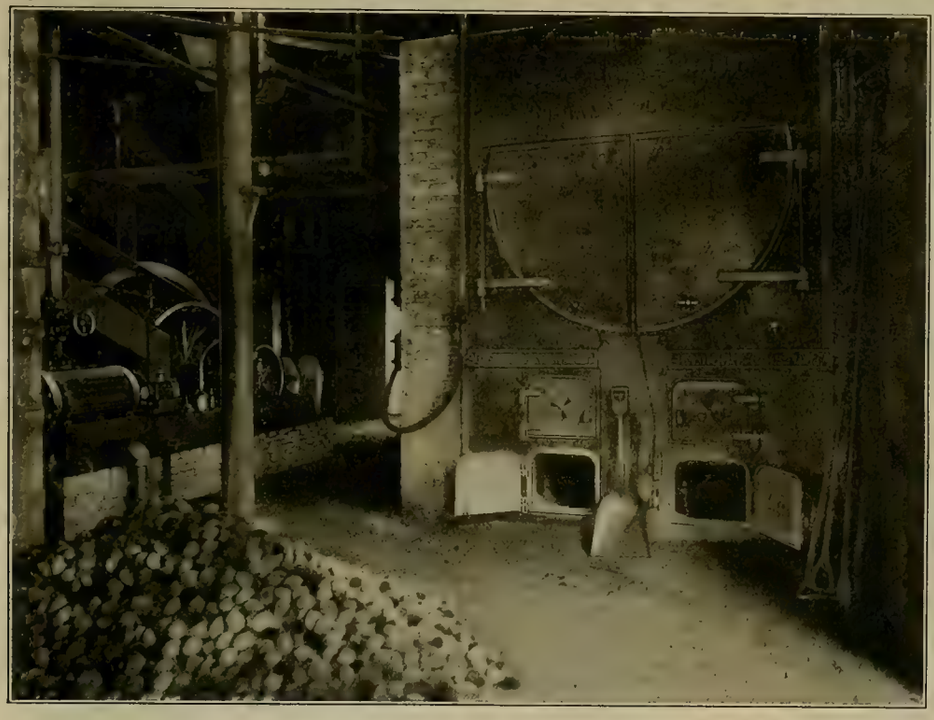
Now, if such action be long continued in a given district, or in a certain fault plane, a considerable body of easily fusible material, rich in metals, will be collected at the bottom thereof; and when comparative quiet is restored by removal of the center of disturbance to some other region, it will naturally not be the first to cool and harden.

While a volcanic region is cooling the rocks must contract, and subsidence of surrounding country is to be expected, which must be irregular, as various rocks vary much in the amount of resistance they offer, and rifts and fissures are a natural consequence. Some of these may extend from the surface to the semi-fluid mass, remaining in the base of the old volcano and furnishing outlets for the same, thus forming dykes of rock worthy a miner's attention. Other fissures will likely also be formed, to be filled with quartz by a process of infiltration, or perhaps be opened and filled simultaneously. Then, again, in some cases there may be a volcanic upheaval not accompanied by ejection of any form of lava other than water, and yet of sufficient force to melt or metamorphose the neighboring rocks and cause uplifting of hills and mountain ranges, with consequent contortion of overlying strata, causing opening and filling of fissures and crevices and the intrusion of granitic masses, which may be exposed by later erosion, the infinite variety of effect being shown on the present surface of the earth.

As to the genesis of ore deposits, there are at least three generic principles to be considered. They are eruption or insertion, sublimation or volatilization, and infiltration or lixiviation. Nearly all known ore deposits are the result of at least two of these forces, and in considering the genesis of any particular deposit it is well to inquire under what condition of volcanic action it was formed.

Ores occurring in basic dykes and consisting of sulphides evenly distributed throughout the mass may be considered as insertions. If pockets occur in them, then they have been modified by one or both of the other forces.

While quartz is usually the product of infiltration, occasionally it is metamorphosed sediment, and more rarely it may be the residue of lixiviation.



The question of sublimation is to be considered only in connection with volatile ores, such as those containing mercury, arsenic, tellurium, chlorine, zinc, bismuth, lead or other factors, which make up volatile compounds with the fixed metals, thus enabling their removal in gaseous form from place to place.

The subject as a whole is eminently worthy of the study of metallurgists. Another generic principle of great importance is that of precipitation of metals in sediments, which has produced some of the greatest mines known, such as those of the Witwatersrand in South Africa, the Calumet & Hecla of Michigan, and perhaps many others. Some may object to this theory on the ground that the cause assigned has not sufficient force to produce the effect, but it appears to me that a force which is sufficient to roll up a tide against the shore twice every twenty-five hours, when assisted by variations of atmospheric pressure, is likely to cause some vibration. A simple calculation will show that the arrival of a tidal rise of 15 feet is equal to an additional pressure of approximately 13,000,000 tons per square mile, while variations of atmospheric pressure may be nearly one-eighth of that amount. And when we consider that the same force that does this work is operating even more strongly against the land areas, it does not appear unreasonable that the earth should tremble just a little where the mountains offer a good leverage.

Incidentally, I would like to inquire concerning the fossils on the classification of which the present structure of geologic theory rests. Is it not possible that many of these varieties of animal life and vegetable growth which are assigned to widely different ages might have had contemporary existence on different parts of the earth's surface, the habitat of each being defined by local conditions of climate and situation? Also, concerning the glacial period, is there any evidence to show whether or not the same has been many times repeated? May not, in fact, all the various phenomena of geology as recorded in the rocks be due to eccentricities of the earth's orbit?

PHILIP MINOR.

Seattle, Wash., Dec. 23d, '99.

Engine and Boiler Room.—(See opposite page.)

THE enormous zinc deposits in Joplin district, Missouri, are, according to some electrical experts, the cause of the trouble which the Western Union Telegraph Company has been having with its service between Kansas City and Joplin. Some time ago the Western Union Company decided to introduce a system which permits the sending of four messages simultaneously over the same wire, two each way. This system has always worked successfully wherever introduced, but in this instance it failed. Efforts to ascertain the cause of the trouble resulted in the company's representatives being forced to the conclusion that the mineral deposits, especially zinc ore, are responsible for the failure. If such is the case and the trouble is caused by zinc deposits a new field of electrical investigation has been opened for scientists as well as practical engineers.—Electricity.

The Coast of Alaska from St. Michael to Point Barrow.

That the rush to Cape Nome in Alaska during the spring and summer of 1900 will far outstrip any previous exodus to the "Land of the Midnight Sun" is generally believed. For several years past, particularly since the discovery of the Klondike gold field, each spring has seen an army of gold seekers, fortune hunters and adventurers turn their faces northward, and they have opened to the world a new country the value of which is being each year more appreciated as its great possibilities become realized. Telegraph lines have been built, railways constructed and much else that characterizes modern progress has been accomplished in that region. The gold along the beach deposits of Cape Nome, the extent of which is as yet unknown, is the chief feature of next season's attractions, however.

Gold occurs at many places along the coast of the Pacific from southern California to Cape Prince of Wales, Alaska, and thus far the experience of those who have practically investigated these shore deposits shows that their richness increases going northward. The beach deposits of northern California are richer than those of the southern part of the State, and those of Oregon are said to be of greater value than those of California. Those occurring along the southern end of Alaska afford variable results, but when Cape Nome is reached, on the edge of the Arctic circle, the gold-bearing sands found there are of unprecedented richness among littoral deposits.

The accompanying sketch illustrates the succession of layers as they have been found to occur in Cape Nome district. The gold in greatest amount is found associated with the layers of ruby sand, which is heavier than the gray sand and clay. Its occurrence in several layers simply indicates that the process of concentration has taken place at several periods, a deposit once accumulated being subsequently covered by shifting currents, which carred the lighter sand upon that previously laid down, or sand driven before the wind piled up dunes over the gold-bearing layer. The growth of moss now found covering the region lying just back from the beach has evidently protected the sand strata from material change for centuries past.

CROSS SECTION OF A CAPE NOME CLAIM.

The following brief description of the coast line from St. Michaels to Cape Barrow will interest those contemplating the northern trip. The data, compiled by J. E. Spurr, under direction of the United States Geological Survey, was obtained before the discovery of gold on the beach at Cape Nome:

TOPOGRAPHY.—In the vicinity of St. Michael the country consists of low, bare mountains of volcanic origin. These same hills run northward parallel with the coast, being usually of only trifling height, although at a distance inland some peaks become probably 1000 or 1500 feet high. Golovin bay, on the north side of Norton sound, is shut in by two high promontories, Cape Derby and Stony cape. The head of Golovin bay is low, and from here a portage extends, by lakes and rivers, to Grantley Harbor. This is the best harbor in northern waters and has been long used by the whaling fleet. The whole coast from here to Cape Prince of Wales is ordinarily low and rocky, and the shore from Cape Prince of Wales to Cape Espenberg, on the southern side of Kotzebue sound, is sandy. On Kotzebue sound the mountains at times come quite down to the shore, especially the Mulgrave hills at the mouth of the Noatak. From Cape Krusenstern, on the north shore of Kotzebue sound, to Cape Lisburne, the coast is generally low and rocky, with sandy intervals. Point Hope is a long sandy tongue of land, backed by steep cliffs at its landward end. From Cape Lisburne to Point Barrow the coast is also low and rocky, with many sandy stretches.

EXPLORATIONS.—The Bering straits were first passed by the Russians in 1648, and again by Vitus Bering, in the Russian service, in 1728. Neither saw America. Captain Cook, in 1778, discovered Cape Prince of Wales, and pushed a long distance northward along the coast. In 1816 von Kotzebue, a German in a Russian ship, discovered the sound which bears his name. Since that time many expeditions have sailed along these shores, especially such as in the early days were seeking a northwest passage, or those which later were engaged in Arctic exploration. For many years this whole coast has been known to whalers and to Government revenue cutters. In the winter of 1897 Lieutenants Jarvis and Bertholf, and Dr. Call, of the Revenue Marine Service, made a remarkable trip with dogs and reindeer from Cape Vancouver to Point Barrow, while two mates of whalers in distress at Point Barrow, Tilton and Walker, made long overland trips—the former reaching Katmai, on Shelikof straits, and the latter, by way of the Arctic coast and the Mackenzie mouth, reaching Edmonton, on the Canadian Pacific. Last summer many prospectors were in Kotzebue and Norton sounds.

NORTON SOUND.—St. Michael is an ancient and well-known trading post and requires no mention. The country within a considerable radius of St. Michael has been reserved for military purposes by the Government. There is a trading post of the Alaska Commercial Company at Unalaklik, and there are missions of the Swedish Evangelical church at Unalaklik, at Kangekosook, and at Golovin bay.

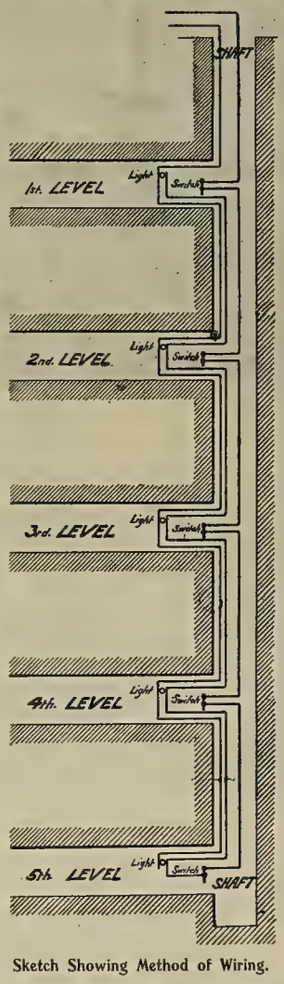
Gold was long ago reported on the Fish river, which heads in Golovin bay, but no mining was attempted. On the same river, thirty miles above the mouth, the Oonilak mine of silver bearing galena was discovered long ago and the Golovin Bay Mining Company, of San Francisco, formed to work it. There was difficulty, however, in getting the ore down the shallow river to the vessel which took it to San Francisco; and, in addition to this, two vessels, with all on board, were lost by the company previous to 1885. In 1890 operations were suspended, owing to the report of experts that there was no continuous vein, but in 1891 work was renewed. The overflow of the Klondike rush turned prospectors into Golovin bay, and in the summer of 1898 many claims were located on the Fish river and other streams in the district. The gold is said to be fine, but of high grade, and to be easy of access; and it is reported that there is plenty of water for sluicing. There were 300 or 400 people in Golovin bay last summer, and last winter probably 200 prospectors spent the winter on the peninsula between Kotzebue and Norton sounds.

ST. LAWRENCE ISLAND.—St. Lawrence is a large island off Norton sound, south of Bering straits. It is comparatively barren, and is inhabited only by natives, with the exception of a few Presbyterian missionaries.

CAPE PRINCE OF WALES AND VICINITY.—At Port Clarence, already mentioned on account of its splendid harbor, is the Teller reindeer station, established by the Government in 1892 through the efforts of Dr. Sheldon Jackson. Mr. Wm. A. Kjellman is the principal superintendent, and there are a number of herders imported from Lapland. There is also a reindeer station at Cape Nome, on Norton sound. The herd increases very slowly, and a large part of it was driven to Point Barrow in 1897 to relieve the distressed whalers. Cape Prince of Wales, the westernmost point of the American mainland, is a bold promontory. Here is the Congregational mission of the American Missionary Society, in charge of W. T. Lopp, and a village of 500 or 600 Eskimos.

KOTZEBUE SOUND.—At Kiktarak, north of Cape Blossom on Kotzebue sound, there is a Quaker mission. The "Fort Morton" appearing on the maps does not exist and never has existed. Near Chamisso island, on the mainland, there is a small trading post for natives. Kotzebue sound, as already noted, was early visited by explorers, and the ice cliffs, especially those in the vicinity of Elephant Point, where the ice plays the part of a geological formation, have been described by many writers. The region has a fairly numerous native population, who speak the Eskimo tongue. On the north shore, however, between Cape Krusenstern and Cape Sepping, there are no natives. In the country between Norton bay and Eschscholtz bay there are also no inhabitants, although a village—Attemut—has been represented on maps.

During the summer of 1898 discouraging reports from the Klondike reaching the west coast, many prospectors turned their attention to unknown parts of the Territory, and a large number poured into Kotzebue sound. Probably 1000 men prospected there during the summer, ascending also the various rivers which empty into the sound. So far as learned, however, no one had any luck, although fine gold exists on some of the streams; the conclusion was reached by most, therefore, that the region is worthless as a gold mining country.



POINT HOPE TO POINT BARROW.—At Point Hope there is an Episcopal mission, and between Point Hope and Point Barrow are several whaling stations, the principal one fifteen miles east of Point Hope and owned by Liebes & Co., of San Francisco. Between Cape Lisburne and Cape Sepping there are occasionally small Eskimo villages, and around the mission at Point Hope there is a large village. Between Icy Cape and Cape Lisburne there are no natives, and very few between Icy Cape and Point Barrow. At Cape Beaufort, and in many places thence northward to Point Belcher, coal of good quality, probably belonging to the Carboniferous period, has been reported. The climate along here is extremely bleak, large packs of floating ice being in the sea all summer. At Point Barrow and at Point Hope the lowest winter temperature is only about 30 degrees below zero, while at Point Hope the average winter temperature is 15 degrees below zero. At Point Barrow there is a Government relief station, designed principally for whalers.

A System of Mine Signalling.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT.

We are using on the Smuggler Mine in Aspen, Colo., a system of signalling not in use elsewhere that might, under certain circumstances, be used with value in other mines where the shaft is lighted by electricity.

In working the cage we have a cage tender who alone is authorized to ring the signal bells to the engineer at the hoister. The trammers bring the loaded cars to the stations and leave them there, the cage tender loading his double-decked cage and sending these cars to the surface. Should the cage be desired at any level we have adopted the following system of signalling the cage tender. We have found by long experience that electric bells in a wet shaft are very apt to get out of repair on short circuit, and generally be very annoying; that around pumps and machinery a noise is not apt to be heard, and it is very unpleasant to wait for the cage for any length of time. But we have also found that if a man is left in the dark that he pays very particular attention to it. There is no chance of his making any mistake; so we run our electric lights down to each level where they are constantly burned. By putting in a switch, no matter where we are, we can send a signal to the cage tender to come to any particular level with the cage. For example, if we desire the cage at the fifth level we flash the light five times, the third level, three times, etc., the cage man answering the signal so that we may know that he has received it.

Sketch Showing Method of Wiring.

The only ingenuity displayed in making this system lies in running three wires down the shaft in place of two, as usual. Were two wires alone run down the shaft by throwing the switch at any level all the levels below him would be left in darkness, but it would have no effect upon the levels above him where the cage might be. If he were at the bottom of the shaft he could make no signals for the levels above him at all, but by the introduction of the third wire

running all down the shaft, and fastening your switches to the third wire, no matter on what level you may be, by throwing a switch you make a flash of the light on every level of the mine whether at the top or the bottom.

By reference to the diagram as given above it may readily be understood. The two wires supplying the light are connected at the bottom of the shaft in place of the top, allowing the third wire to do all the work.

The Occurrence of Tin.

Tin, although one of the most useful of metals, is found in only a few localities, and its modes of occurrence present many singular features, says A. S. Brown in the Australian Mining Standard. In Europe it is principally mined in Cornwall, and in small quantities in the Erzgebirge, between Saxony and Bohemia, in Sweden, Spain, France and Italy. No tin deposits of importance have been discovered in Africa or in North America; but in South America a tract of country about 1000 miles in length, starting in Peru and running in a southeasterly direction through Bolivia, is tin-bearing. Asia is rich in tin lands. Tin is found in Bengal, China, the Malay Peninsula, the islands of the Malay Archipelago, and Japan. Australia possesses larger tracts of tin country than any other part of the world. The tin-bearing areas of Australasia are four times larger than those of Europe, and nearly eight times larger than those of Asia. The principal Australian tin fields are in Tasmania, Queensland and New South Wales.

The principal sources of tin supply are Cornwall, the Malay Peninsula and Archipelago, and Australia. The average production of tin, calculating on the returns for the years 1890-1898, is 80,000 tons per annum. Of this amount the following countries contribute: Straits Settlements and East Indies, 79.6 per cent; Australasia, 7.9; Cornwall, 6.1; Bolivia, 6.0; the minor producers, 0.4. The Australian yield is divided as follows: Tasmania, 35.85; per cent; Queensland, 32.70; New South Wales, 25.90; West Australia, Victoria and South Australia, 5.45.

Tin is almost entirely obtained from the native oxide cassiterite or tinstone. Cassiterite is frequently found in brown, ruby, reddish, or black short prisms, with four or eight pyramidal summits, and in reniform-botryoidal, fibrous and granular masses, and sometimes as pseudomorphs, after the quartz crystals and the other mineral constituents of granite and porphyry, and after hematite and magnetite. Often in lodes where the quartz is crystallized cassiterite fills in the interstices, and specimens can often be obtained of a quartz-tin porphyry in which the cassiterite forms the ground mass. Cassiterite is rarely pure. The principal impurities are shown in the following results of analyses. A is the composition of a dark-colored, almost black, crystal of cassiterite found in Vegetable creek, New South Wales; B is the result of assay of a crystal from Cornwall; C is the assay by Berzelius of a crystal found in a Swedish mine:

	A.	B.	C.
Oxide of tin	80.92	99.00	93 6
Oxide of iron	2.30	0.25	1.4
Alumina	6.75	0.00	0 0
Silica	0.80	0.75	trace
Titanic acid	0.69	0.00	0.0
Columbic acid	0.00	0 00	2.4
Peroxide of manganese	0.00	0.00	0.8

Tin occurs also in the form of tin pyrites; both in amorphous masses and in minute cubical crystals of a yellowish-grey color. The following is the result of an analysis of a group of crystals: Tin, 25.55 per cent; copper, 29.39; iron, 12.44; sulphur, 29.64. Tin pyrites is found in few localities in small quantities and does not form a commercial ore.

Cassiterite is generally associated with quartz, orthoclase feldspar, bismuth, magnetite, molybdenite, iron, copper and arsenical pyrites, zincblende, fluorspar, calcite, zircons, garnets, beryl, topaz, tourmaline, tellurium, wolfram, manganese, barytes, chlorite, mica, and sometimes with diamonds, thorium, platinum, the platinoid metals, and the cerium earths. In minute quantities it is a constituent of a large number of minerals, and particularly of augite, hornblende, lepidolite or lithia mica, and other minerals found in granite, gneiss, eurite, porphyry, greisen, or other igneous rocks. Cassiterite is found in alluvial deposits, in lodes, and scattered in rock-masses. The greatest quantity of tin is found in alluvial deposits. The most important alluvial deposits are in the Malay Peninsula; the average of the annual shipments of Malacca tin from the Straits Settlements during the year 1890-97 was over 44,000 tons of 68 per cent ore.

The alluvial deposits of this region are found in most of the valleys running from the mountain ranges, and are composed of pebbles of quartz, igneous rocks, clay and coarse tinstone. The wash varies in depth from a few inches to 20 or 30 feet. In places it is covered by a thick overburden of clay. The value of the wash varies considerably, but the average may be taken to be about 30 pounds or 40 pounds of tinstone to the ton. The principal metallic impurities in the concentrated tin are ilmenite or titaniferous iron, and to a much less extent wolfram. As the specific gravity of ilmenite is generally under five, and that of cassiterite is nearly seven, they can be separated by careful washing.

In other parts of the world alluvial tin deposits are similar in character, but sometimes they are overlain by igneous rocks, chiefly basalt, and in Australia they often contain gold and plantinum, and sometimes diamonds and other gem stones. In New South Wales tin occurs in association with diamonds in Tertiary river drifts, and in cements formed in old river channels in different geological periods.

Typical Mining Scenes.

When looking at the large and expensive plants erected at great mines the early history of the property is often lost sight of entirely, being overshad-

The First Hoisting Plant.

Hoisting With a Horse Whim.

Building an Arrastra.

The Miner's Home.

owed by the magnitude of operations. Every mine, no matter how great or how rich, had a beginning, and many of them when discovered were located in the midst of forest-covered, rugged mountains, many miles distant from the nearest town. Into this wilderness the prospector forced his way and made a discovery. His first step is to locate the vein and the next to develop it to a greater or less extent as his means and the character of the prospect will allow. Having proven the new discovery valuable he builds a cabin and sets up a windlass. Assuming that his prospect develops satisfactorily, he later builds a horse whim and continues his shaft. Perchance the ore is rich enough to pay by primitive methods, and he accordingly builds an arrastra and makes the prospect, now developing into a mine, pay its own way. Thus, step by step, he builds up what in time may become a great industry. Others are attracted to the vicinity by his success, and other mines are opened and a town is started which grows with greater or less rapidity and becomes permanent or transient in direct proportion to the success and length of life of the mines. The accompanying engravings illustrate familiar scenes in the mining regions.

MINING SUMMARY.

ARIZONA.

MARICOPA COUNTY.

Fifty miles north of Phœnix and six miles west of Hot Springs Junction on the Santa Fe, Prescott & Phœnix railroad, a new copper strike has recently been made, which is being developed. A company has been formed by the owners, which is known as the Aztec Mining Co., with J. G. Evens president.

YAVAPAI COUNTY.

G. P. Harrington has completed repairs to the Tiger mill, which, after an idleness of four years, has started up again. The mill was equipped with pans and settlers for the treatment of silver ore. It has been changed to a gold mill.

The new forty-ton furnace of the Big Bug Smelter has been successfully blown in. Mr. Clifford says he will add another stack. He also reports another discovery in the Lone Pine, at a depth of 225 feet, where a crosscut has been run which cut an ore body 27 feet wide. There are streaks in it which assay 25% in copper, and the average is 6% in copper and $8 per ton in gold.

The report is again in circulation, emanating from Boston, to the effect that the Amalgamated Copper Co. is negotiating with W. A. Clark for the United Verde.

MOJAVE COUNTY.

The Merrimac concentrator at Chloride is about completed. A large amount of ore has been accumulated during the installation of machinery, and there are reported several thousand tons blocked out above the 300 level in the mine.

The Midnight mine at Chloride has developed within the past few months from a promising prospect into a shipping mine. A large body of silicious gold ore has been developed on the 200 level.

M. L. Requa and M. D. Rochford will sink a 500-foot shaft on the property recently bought by them near Stockton Hill.

While doing assessment work recently on the Little Chief mine, near Stockton Hill, a rich vein of silver ore was found.

GILA COUNTY.

The United Globe mines are shipping two to three carloads of ore per day to the Copper Queen smelters at Bisbee.

F. Trego has run a crosscut tunnel 260 feet and has cut 25 feet of low-grade ore, averaging 4% to 5% copper, near Globe. There remains 50 feet to go to strike the main ledge.

Native copper has been found in the Alliance mine, in Lost gulch, adjoining claims of the Black Warrior Co. It is being developed by the Lost Gulch Copper Co. The ore is from a winze down 45 feet from the tunnel level.

PINAL COUNTY.

N. S. Wight, formerly of California, is shipping ore to El Paso from the Cuba mine, near Mammoth. The ore is rich in copper, silver and lead. A new shaft has been started on the apex of the lead and struck high-grade ore at 10 feet.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—Prof. Blackledge has started a school of chemistry and metallurgy at Pine Grove and the mining men of the district have not been slow to take advantage of it.

Messrs. Cox & Heydenfeldt spent the past week here testing a machine for saving fine gold. It was so much of a success that they will make arrangements to take 500 of them to Cape Nome, where they are to return in the spring.

The Volcano Ditch Co. have almost completed their extensive repairs to flumes, pipes, etc., and it is expected the water will be turned in before many days, after which mining will be resumed with some energy in this section.

The crosscut in the lower level in the Spagnolia shaft is now in 70 feet and the ledge is expected to be tapped within the next 10 feet.

Wieland, Dec. 26th, '99.

H. W. Tangermann, owner of the Clinton gravel mine, near Wieland, is working one giant. The property includes the Boyrie mine.

CALAVERAS COUNTY.

The water is out of the Sheep Ranch mine, and, after some repairs to the shaft have been made, the opening of a new level will be commenced at the 1200 station. The mill will be completed about the 1st of February. The mine was closed in 1893, after the shaft had been sunk to 1200 feet. Supt. Garbarini says he found good ore in the faces of several levels.

It is reported that the Edna mine, three miles northeast of San Andreas, has been sold to a Dutch syndicate. The Edna is developed in a large gold-bearing dyke, the pay rock following a zone of sheeting and crushing. On the western side and forming a part of the zone is a quartz vein of large size.

In a crosscut east from the shaft at the 300 level of the Commodore mine, a mile north of San Andreas, Supt. Clarey has cut the ore shoot, and a mill is being talked of for this new mine.

C. & G. Snyder have developed a claim near El Dorado. They have started the Rose Hill mill, on the Emery mines, running on their rock.

Work on the Ritter, near El Dorado, has been temporarily suspended, pending the building of a 5-stamp mill on this property. The tunnel is in 450 feet. M. C. Rigney is in charge.

The Utica M. Co. have secured control of the Confidence mine, adjoining the Utica, at Angels.

Henry Beagan claims to have discovered a quartz ledge on his claim, near the Calaveras Big Tree grove, the ore running $3 to the ton.

San Andreas Citizen: The sinking of the main shaft of the Demarest mine, south of San Andreas, from the 400 to the 600 level, has commenced.

EL DORADO COUNTY.

Teamsters are hauling slate from the Strahle quarry at Kelsey to Placerville.

At the Pioneer copper mine, near Pilot Hill, twelve men are employed on development work. New buildings have been built. The ore contains gold and silver and 8% copper.

A full force is employed at the Cambrian and the 10-stamp mill is running. In the last six months many improvements have been added to the property.

The old Tobner tunnel at the American River mine, below Coloma, is now in 160 feet. There is a 5-foot ledge which is reported to show good prospects. The mine is run by Casey & Sons.

A strike is reported at the Schneider mine, near El Dorado. The mine is bonded by Hill & Bryant. A tunnel has been run 750 feet. Recent developments exposed a vein 3 feet in width showing gold.

At the Blue Gouge the framework and roof of the mill are up and most of the new machinery is in place. Thirty men are employed. Some delay has been occasioned by unusually cold weather.

At the Griffith Con. mine, in Diamond district, a test run is being made from the several levels of the mine. It is said the company intend to sink the main shaft from 700 to 1200 feet.

MADERA COUNTY.

Placer bars along the Chowchilla creek, two and a half miles from Grub Gulch, are to be hydraulicked next summer. A ditch will convey 1000 inches of water to a point near the mines. The giants will operate under a 250-foot head. The Chowchilla, though a good sized stream near its headwaters, sinks in the foot hills bordering the plains of the San Joaquin, and the debris from the mines would never reach the San Joaquin.

RIVERSIDE COUNTY.

It is reported that the English company controlling the old Gavilan gold mines on the San Jacinto estate have arranged to buy the Santa Rosa mine, two miles distant. The latter property has had many vicissitudes, though having the appearance of a valuable mine.

The Indian Queen mine, five miles west of Perris, has been developed into a promising property by Mr. Anderson. The ore is high grade.

The Menifee mine, eight miles south of Perris, has passed into the hands of Chicago capitalists. Development work will be resumed, new buildings erected and a new milling plant installed. The main shaft is down 130 feet with drifts, and the ore is mostly stoped and worked from the 65-foot level to the surface. The new management will run the main shaft down 500 feet. The vein was opened by several former workers, who took out about $15,000 with a small mill, but quit, owing to water.

SAN BERNARDINO COUNTY.

R. M. Furlong and J. R. Taylor, of Pasadena, have commenced operations on the Copper Bullion mine, owned by W. G. Hixon, near Manvel, the northern terminus of the Nevada Southern railroad. This deposit consists almost wholly of chrysocolla (copper silicate) in limestone. The ore occurs irregularly, but is found at numerous places on the low ridge upon which the claim is located. The new owners will ship the ore.

SAN DIEGO COUNTY.

Recent discoveries of gold and silver-bearing veins and of other minerals in this county at various places between the Cuyamaca range and the coast has stimulated prospecting. The discovery of new kaolin deposits on the Jamul ranch is reported. The construction of the large cyanide plant for the Golden Cross mines at Hedges is in progress. It is thought it can be completed by Feb. 1, 1900.

SHASTA COUNTY.

A miner is working a continuous discharge arrastra and will put in a concentrator.

F. H. Dakin and B. M. Newcomb have sold to Spier & Miller of New York City a tract of land near the mouth of Squaw creek, near the Uncle Sam mine. The purchase includes a large mill or smelter site and is conveniently located to receive ore from a number of mines in the vicinity. It is also reported that Mr. Dakin had sold the Uncle Sam mine for $50,000. A long crosscut tunnel is to be driven to open ore shoots on the Uncle Sam.

SISKIYOU COUNTY.

It is reported that H. J. Barton has sold the Poverty Point mine, at Oak Bar, to W. O. Linhard and others.

TUOLUMNE COUNTY.

At the Buchanan mine, near the main Tuolumne river, twelve miles southeast of Sonora, workmen recently cut a large vein of gold rock in new workings. The identity of this shoot is uncertain, as there are several veins in the property in close proximity. The old workings are extensive and 800 feet deep. These are filled with water, and the new shaft and workings extending from it are close to these old stopes and workings, and the situation appearing one of unusual risk, the miners quit, refusing to work under existing conditions. Several old mines in California which have been opened in recent years have had a similar experience, and in each case it was shown that the unwatering of the old works was the only solution of the problem.

COLORADO.

BOULDER COUNTY.

Ward Miner: At the Pennsylvania mill at Sunnyside the steam power plant and electric plant are being installed. The shaft has been unwatered and men will be at work in a few days running the 200 and 300 levels both ways from the shaft. This work will soon be supplemented with the driving of a crosscut 75 feet from the lower level to cut the Brooklyn lead, which has a fine surface showing.—The old Smuggler mine at Ballarat is putting up a power house and mill on the Middle St. Vrain, at the mouth of Ballarat gulch. In it will be installed an electric plant to furnish power for mine and mill. A tram road one mile in length will run from the mine to the mill. The old property has taken on a new lease of life and is looked to as a steady producer. Twenty pounds of closely sorted ore from the mine recently returned $265.

LAKE COUNTY.

The Iron Silver mines and mill are making an output of about 200 tons per day, 6000 tons being the output of November, and that of December will duplicate it.

The Best Friend mine, after a long idleness, is to resume operations under lease and bond to Johnson & Co.

The Miner Boy at Leadville is shipping gold-bearing lead carbonate ore. The ore occurs in a fissure traversing the sulphide ore bodies and is supposed to be associated with the Colorado Prince fault, which at various points along its course carried ores.

Leadville Miner: It is reported that negotiations are pending for a lease of the Long and Derry mines to a company of Leadville miners and Eastern capitalists, and if the negotiations are completed preparations for starting up will begin in January.

OURAY COUNTY.

Denver Republican: The most important mining enterprise projected in Ouray county the past year has recently been consummated through the sale of the Blaine group of sixteen claims, north of Mount Sneffels, to a Canadian syndicate, which has commenced to develop the property and has a large force at work at the mines and in road construction. The shipping and receiving point being Ridgway, it is necessary to construct eight miles of road, and men are paid $2.50 per day and board to work on the same. The sixteen mines and two mill sites at the head of East Dallas creek originally belonged to Dr. Judd. Louis Sherbino purchased the group from the heirs of Dr. Judd and transferred it to the Canadian syndicate. In 1893 Sherbino let a contract to T. H. Brown for a tunnel 1000 feet long, which was completed. Another contract for a 1000-foot tunnel has been let by the present owners. Some valuable ore was shipped from the original tunnel and this fall several shipments were made, the ore running high in silver, with gold.

PARK COUNTY.

Mining in Park county is more active about Alma than in many winters past, and much dead work is being accomplished. The developments of the past season have proven the continuity of the gold belt from Leadville over Mosquito pass into Park county. At Park City the Brownlow gold mines are being developed, the shaft being unwatered, and the levels extended.

TELLER COUNTY.

The Homestake mine on Big Bull hill is again to be developed. The property has been secured under lease by Rogers and associates. There has been some ore shipped from this property in the past, but attempts to find the ore shoot have been unsuccessful.

A shipment of eighty tons sent out by the Alert Leasing Co. from the Hardwood of the Damon Co. last week is estimated at two ounces to the ton.

A fifty-ton shipment of three-ounce ore was sent from the Clements lease on the Dante last week.

At 2:30 P. M. on the 18th inst., at the dam site of the Pike's Peak Power Co. on West Beaver creek, six miles east of Victor, 100,000 cubic feet of granite were torn from Vesuvius butte and dumped into the stream below, where the fragments may be utilized in the construction of the steel-sheeted dam. To accomplish this a tunnel was driven under the butte at the proper level, from which crosscuts were run. When completed 600 pounds of dynamite and 30,000 pounds of black powder were placed in the excavation and the entrance tamped. The blast was fired electrically and the top of the hill arose and slid into the stream. The noise of the explosion is described as a subdued rumble and the shock to the observers 1000 feet distant was scarcely noticeable. The operation from an engineering standpoint was a success.

On the Burns claim of the Acacia Co. Lessee McGill has struck a 15-inch vein running over $200 per ton.

IDAHO.

BLAINE COUNTY.

At the Red Cloud group of mines preparations are made for all winter; the mill will run continuously.

BOISE COUNTY.

A gold strike in the Willow Creek district is reported near the Checkmate mine. No details have been received.

IDAHO COUNTY.

A strike has been reported in the Magnolia group, in the Miller district, where the ledges in the Magnolia and Joe Jefferson, the principal mines of the group, had been tapped by the crosscut tunnels and rich showings made. Beyond the footwall of the Joe Jefferson ledge, it is stated, a rich streak of ore was found. All the assays run high, one being over $600 a ton. Assays of Magnolia ore also run high.

SHOSHONE COUNTY.

A report comes from the Banner mine that galena occurs in the country rock in the face of their crosscut tunnel, though they have not reached the vein.

The Silver King mill has been making trial runs for several days and a number of changes were found necessary. The supply of water is insufficient. The gulch does not furnish enough water for power at all seasons, but will run the little mill most of the time.

MONTANA.

SILVER BOW COUNTY.

At Butte on the 28th the District Court decided the suit of the Montana Ore Purchasing Co. against the Boston & Montana M. Co., to settle the ownership to certain veins of copper under the Rarus and Johnstown claims, owned by plaintiff, and the Pennsylvania, owned by defendants, in favor of the plaintiff. The trial of the action was before the court without a jury and occupied ten weeks. The judge has had the case under consideration two months. The Ore Purchasing people contended in this action for an east-and-west vein system apexing in their ground, and the Boston & Montana people contended on the other side for a north-and-south vein, which would cut off the rights of the Ore Purchasing Co. to follow the veins from their apex upon the dip to the south. It is said the trial and preparation for trial in development work represented an expenditure of over $500,000. The case will be carried to the Supreme Court of the State for review, and possibly to the Supreme Court of the United States. Attorneys for the plaintiff say the decision will be followed at once by suits for about $1,500,000 damages for losses sustained by reason of work being stopped while the Boston & Montana injunction was pending. It is also stated that as soon as several lateral points are settled work will be started on the veins so long in dispute and 500 men put to work.

Judge Clancy, sitting in chambers, dissolved an order issued by him recently restraining and enjoining the Anaconda M. Co. from working certain portions of the Copper Trust mining claim, which, it is

alleged, overlaps part of the St. Lawrence and Anaconda locations. The signing of the restraining order was one of the adjuncts to the suit instituted by Burdette O'Connor against the Anaconda Co. for $2,000,000, the value of ore alleged to have been stolen by the Anaconda from the veins having their apex within the lines of the Copper Trust lode claim.

NEVADA.

LINCOLN COUNTY.

A strike was recently made in the Crown Point, three-fourths of a mile above the town in Stateline district, between the Johnny and the Sunflower. J. R. Smithson, owner of the claim, did the assessment work this year in the old shaft, which is 60 feet deep, where the work has been done on the claim for four years. After finishing work he went up the hill along the ledge about 40 feet to store some powder and tools in a cleft of rock. He broke off a piece of quartz sprinkled with gold, and on investigation the ledge proved to be 5 feet wide.

NEW MEXICO.

SANTA FE COUNTY.

The Gallisteo M. Co. will install new electric machinery. Mr. Burns has men preparing the grounds upon which to operate the excavators, which are to handle 30,000 cubic yards of gravel daily when completed. The excavators are to convey the gravel to trommels, which will concentrate the smaller heavy gravel and gold. These concentrates will then be placed in separators operating entirely by the process invented by Mr. Edison. In addition to the placer machinery this company will open up ten lode claims and establish an electric generator at its coal mines, two miles from the center of the gold mining properties. All power used in mining operations will be by electricity.

OREGON.

BAKER COUNTY.

(Special Correspondence.)—It may interest the readers of your paper to know that in the course of my work on the ores in this section I have determined the occurrence of free gold with the mineral scheelite (tungstate of calcium). The mineral is found in quantity in the massive form in the Cliff mine, in the Virtue district, a few miles east of Baker City. At water level the vein matter seems to be entirely scheelite, and single specimens assay as high as $100 per ton, the gold being almost entirely free and of a very high grade. CLARENCE S. KING.

Baker City, Or., Dec. 24th, '99.

[In the Black Hills of South Dakota gold occurs associated with tungsten ores, particularly with wolframite, at the Grantz' Hidden Fortune, the Durango and other mines near the Homestake, at Lead City.—ED.]

The sale of the Diadem mine was closed on the 21st inst., after having been under bond for a few weeks, the final payment of $40,000 being made. The ledge consists of soft, decomposed rock, which requires little blasting. The main shaft has been sunk 50 feet and has 36 inches of ore, carrying $165.56 in gold, with silver, lead and copper.

SOUTH DAKOTA.

The annual report of the State Inspector of Mines recently issued shows the output of gold in the Black Hills for the year 1899 to be $9,131,436. This is an increase of $2,000,000 over the output of the previous year.

CUSTER COUNTY.

Another rich strike is reported in the Holy Terror mine in its lowest workings.

The Vigilante M. Co. has struck a vein of rich copper ore in its mine, five miles from Custer. The ore is found on the 300-foot level. The width of the vein is 10 feet.

Custer Chronicle: The Grand Junction mine, which is held and operated by J. C. Spencer and C. C. Crary, is undergoing development, and considering the unusual hardness of the rock is making good headway. It is a free milling and concentrating proposition, and the ore exhibited shows free gold, much of which is coarse. The shaft is over 65 feet below the level of the tunnel, and the water is coming in rapidly. This mine was sold in 1879 by the discoverers, when less than $2000 worth of development had been done for $125,000.

LAWRENCE COUNTY.

Two companies were organized in Deadwood last week to operate in the phonolite district west of that city. Colorado capitalists are interested in each.

Sylvanite ore has been found in the Ironsides mine, on Squaw creek, nine miles northwest of Deadwood. This mine was purchased by the Colorado & Deadwood M. Co. for $75,000. This company will have its new plant installed at the mine by Jan. 1st and a tunnel will be run in several hundred feet. There is considerable rich ore on the dump, which will be shipped to Denver when the wagon road is finished from the mine to the railway station on the Burlington road.

C. D. Wood of Denver has bonded the McDermott claims near the Ironsides mine, in Spring gulch. A force has been put to work following a streak of ore. A shaft has reached a depth of 80 feet.

R. W. Griswold of Colorado Springs is working a vein on the Granite Mountain claim, on Squaw creek, and ore followed resembles the sylvanite found in the Ironsides mine. F. Wilbur of Cripple Creek is Supt.

A cyanide plant of 1000 tons daily capacity is being built for the Homestake Co. near Lead City, in Gold Run. Owing to the steepness of the hills in the narrow gulch, heavy retaining walls are necessary. The plant will not be completed for several months. It will take tailings directly from the mills, there being no tailings accumulated.

PENNINGTON COUNTY.

The sale of the Alta-Lodi mines at Altaville is reported. This property was sold by the discoverers years ago to an Eastern company, which built a large mill, spent many thousand dollars uselessly and closed down, condemning the mine and the country. A few years later the property came into the possession of James Cochran, who worked it alone, crushing his ore in a rotary mill and made it pay, the large mill having been removed to the Lookout mines on Castle creek. The new company now taking the mines are to build a large mill. The ore is quartz mica schist, and though not rich is abundant.

Ore was first discovered in Hornblende Camp in the summer of 1897. The ore is hornblende and free milling. The gold-bearing shoots occur in broad zones of hornblende schist.

UTAH.

SALT LAKE COUNTY.

The Highland Boy is shipping about 120,000 pounds of base bullion weekly. It consists of copper containing a variable amount of gold and silver.

J. S. Pine has made a payment of $10,000 on the Queen of Utah group, in Dry canyon, the purchase price being $40,000. It is said to be in the same geological horizon as the Mono mine.

UINTAH COUNTY.

R. A. Kirker is developing deposits of hydrocarbon in the Whitmore canyon section.

Jos. Leiter is in Salt Lake in the interest of the elaterite deposits in which he is interested.

WASHINGTON COUNTY.

The Grand Gulch copper mines, near St. George, are shipping high-grade ore. The ore runs nearly 40% copper.

The new smelter of the Apex Copper Co., near St. George, was blown in on the 16th inst., and at last accounts was running successfully. G. A. Walker, manager.

WASHINGTON.

FERRY COUNTY.

The last payment of $17,000 on the bond of the Review mine, Meyer's Creek camp, has been made by McEntire, McDonnell & Co., of Spokane. The Review G. M. Co., of Spokane, now owns the property. J. Mulhollan and R. Allison were the locators and sellers.

STEVENS COUNTY.

The Deer Trail No. 2 mine is under new management. C. D. Rand is Pres. and N. B. Buckler Sec'y and Mgr. Upon the organization of the new board the nineteenth dividend of $2500 was declared, payable Dec. 25, making a total to date of $47,500. The ore is rich in silver and is shipped.

WYOMING.

CARBON COUNTY.

The company which bonded the Kurtz-Chatterton mine, near Grand Encampment, have agreed to put in a 25-ton smelter within six months of the date of the bond and lease. There are 1600 feet of development work on the property.

A controlling interest in the Eureka mine has recently been sold to an Eastern company for $20,000. The property comprises eighty-five acres four miles from Grand Encampment. Additional machinery will be placed on the mine.

A 2-foot vein of copper ore has been struck on the Bragg claim, the property of the Copper Belt Copper M. Co., in the Battle Lake district.

LARAMIE COUNTY.

Copper ores are being shipped from Rawhide Buttes to Aurora, Ill. These mines were discovered in 1878 by J. Hildreth and party, and at that time a large amount of development work was done; but lack of cheap transportation made it impossible to work to a profit at that time. The ores occur in a slate formation similar to those found in the Black Hills of South Dakota.

FOREIGN.

AUSTRALIA.

The gold yield of New South Wales for the first eleven months of 1899 amounted to 449,000 ounces, being 163,000 ounces in excess of the yield for the corresponding period in 1898.

The Queensland gold returns for the month of November are as follows: Charters Towers, 76,600 tons crushed, producing 48,200 ounces; Croydon, 3000 tons, 2300 ounces; Gympie, 9400 tons, 8000 ounces; Mount Morgan, 20,900 tons, 18,300 ounces; other fields, 17,400 tons, 6000 ounces; Alluvial, 1000 ounces. Total, 83,800 ounces.

BRITISH COLUMBIA.

It is now reported that the alleged discoveries of gold, copper, etc., in the Great Slave Lake country were much overrated. Parties returning from there report no gold and little copper, but say galena ores were found in limestone.

Porto Rico mine is owned by the Canadian Pacific Exploration Co., and has been worked for eighteen months. The ledge is 5 feet in width and the ore high grade, carrying free gold. A 10-stamp mill is in operation and thirty stamps are being added. Fifty men are employed at the mine and twelve at the mill.

J. F. Herrick, manager of the Iron Mask Co., reports that the shift working in the winze in the 400 level has broken into the ledge.

J. E. Saucier has interests in East Kootenay, which he has recently examined. He reports that on the Pay Roll three shifts are at work. The tunnel is in 140 feet. The ledge is 7 feet wide and the ore high-grade galena.

Col. Baker, who recently returned from London, reports that he and his associates will erect a smelter in the spring at some central point in East Kootenay. Mr. Baker is one of the largest stockholders in the Theo Gold-Copper Co.

MEXICO.

Chihuahua Enterprise: Manager Long is engaged in making preparations for operating several new mining properties belonging to the Hidalgo Co. Their works will be largely increased for the coming year.

NEW ZEALAND.

The New Zealand gold output for November was 26,829 ounces, valued at £204,072, as compared with 16,721 ounces, valued at £64,056 in November, 1898. The increase in the output of the colony for the past eleven months, as compared with the first eleven months last year, is 100,479 ounces, of the value of £400,617.

It is only about ten years since the cyanide process was first introduced on a commercial basis at the Crown mine.

SOUTH AFRICA.

The November output of the Robinson, Bonanza and Ferreira Deep mines on the Rand is stated to have been 12,000 ounces. The mint at Pretoria is coining 100,000 sovereigns monthly.

Commercial Paragraphs.

THE Union Iron Works of San Francisco will erect a 40-stamp mill and cyanide plant for the Octave G. M. Co. at Weaver, Ariz.

THE Edward P. Allis Co. of Milwaukee, Wis., will in future be represented in Spokane, Wash., by F. D. Howe and Edmund Juessen.

THE Westinghouse Electric and Manufacturing Co. of Pittsburg, Penna., now has its London office in the Westinghouse building, Norfolk street, Strand, W. C.

M. SELIGSON, Denver, Colo., has a method of producing chlorine-ammonia gas and passing it through a mineral pulp to dissolve the slimes which carry the values.

MCFARLANE & CO., Denver, Colo., have commenced the manufacture of a new geared hoisting engine of the gyratory-reciprocating type, designed by Harold J. Bell, C. E. The first one completed is to be installed at the Baxter mine, Gilpin county, Colo.

THE University of Minnesota has recently added to its laboratory a Calkin's automatic cupel machine and two L. & C. assayer's furnaces, manufactured by F. W. Braun & Co., Los Angeles, Cal., who have also received an order for one of Calkin's automatic cupel machines to be shipped to London, England.

HENRY E. WOOD, assayer and chemist, Denver, Colo., has established ore testing works, which include wet and dry crushing, amalgamation, concentration, chlorination and cyanidation. In this plant is also an exemplification of the Webster system of heating, adapted to mills and reduction works. Mr. Wood is equipped to test ores in carload lots.

Industrial Notes.

—The U. P. R. R. will open another coal mine at Rock Springs, Wyo.

—Alaska is to have a $500,000 Government appropriation for lighthouses.

—The Santa Fe expects to be operating its through lines into San Francisco by March 1st, 1900.

—The Butte County, Cal., Electric Light and Power Co. expect to supply consumers February 15, 1900.

—Hydraulic mining is now nightly carried on in Trinity county, Cal., by use of acetylene gas light.

—Hawaii and South Africa ask for even more lumber from the Pacific coast in 1900 than they took in '99.

—The last spike of the Santa Fe & Grand Canyon railroad, Arizona, will be driven February 15, 1900.

—The Standard Oil Co. is trying to lease 180,000 acres of oil land in Indian Territory for $57,000 per year. The Indians protest.

—California built 209 miles of railroad in '99, New Mexico 125, Montana 88, Colorado 130, Oregon 71, Washington 78, Arizona 75.

—The Congressional Industrial Commission will investigate manufacturing business and labor conditions on the Pacific coast next February.

—British Columbia engineers have accurately surveyed, determined and marked the Atlin boundary line between British Columbia and the Yukon territory.

—The average cost in foreign countries of all sugar imported into the United States in the fiscal year 1872 was 5.37 cents per pound; in 1899, 2.39 cents per pound.

—Several large American manufacturing establishments will not be represented at the coming Paris Exposition, being too busy filling orders to attempt preparation of appropriate display.

—The Mammoth Mining Co., Tucson, Ariz., will put in an electric power plant on the Aravaipa river, fifteen miles from Mammoth, to run the mill, tramway, hoist, etc., and light the works.

—A bill for laying a cable to Hawaii, Guam and the Philippines is before Congress, in which the cost is limited to $8,000,000, and a preliminary appropriation of $500,000 is made to begin the work.

—The Postmaster-General calls for bids for furnishing improved mail service between San Francisco and Sydney, N. S. W., for an optional term of either five or ten years, beginning November 1, 1900.

—The Southern Pacific and Santa Fe roads will not accept freight cars over 41 feet in length for points south of Portland, Or., unless the freight cannot be accommodated in shorter cars, when special arrangements must be made.

—The United States Supreme Court has affirmed the opinion of the Court of Claims in the case of the claim of the Los Abra Silver Mining Co. against the Republic of Mexico, holding that claim to be fraudulent and unfounded. The claim was for about $4,000,000.

—The largest ice plant ever built in the United States goes to Manila on a Government transport, leaving San Francisco on the 3rd prox. It will daily produce fifty tons of ice and 6000 gallons distilled water, besides refrigerating a room designed to hold 5000 beeves, 7500 sheep and 100 tons each of salt meats, butter, eggs, etc.

—American refrigerating machines, American pumping machinery, American mining machinery, run by American miners, an American dynamite plant, 150 miles of American railroad, laid with American rails on California redwood sleepers, and American water lines, are some of the American products at the South African mines.

Books Received.

"Mine Drainage," by Stephen Mitchell, 4to pp. 369, second edition, rewritten and enlarged, profusely illustrated, a practical treatise on detailed methods of draining mine workings by direct-acting steam pumping machinery; a new and improved form of a standard English work on that subject. Pumping engines, horizontal and vertical, are thoroughly discussed; their make, merits and application gone into in detail, and nearly everything in direct or indirect connection therewith comes in for exhaustive mention. To the American reader much said relating to styles and methods has a foreign flavor, and not all of the statements will be wholly accepted. In scope and treatment the work is a valuable one, and will attract deserved attention. It is published by Crosby Lockwood & Son, London, and furnished to the American trade by D. Van Nostrand Co., 23 Murray St., N. Y. City; price $10.

Personal.

A. F. HOLDEN has been elected Pres. Centennial-Eureka, Utah, M. Co.

WALTER HOVEY HILL has returned to Grangeville, Idaho, from Newsom.

JAS. H. KINKEAD is now Supt. Best & Belcher M. Co., Virginia City, Nev.

J. B. CORBUS of the Alaska-Treadwell mine, Douglas Island, Alaska, is in San Francisco.

W. P. MILLER is making a professional examination of the Balaklala mines of Shasta Co., Cal.

C. W. MERRILL of Alameda, Cal., who is erecting a cyanide plant at Lead, S. D., has returned home.

THOS. W. FOSTER has been appointed Supt. Bennington group of mines near Keswick, Shasta Co., Cal.

H. D. CRIPPEN, Mgr. of the Jackson Drill & Mfg. Co., Denver, Colo., will be at his New York office during the winter.

RICHARD A. PARKER has been elected Pres. American Zinc, Lead & Smelting Co., succeeding A. F. Holden, resigned.

P. P. BUSH of Denver, Colo., Western Mgr. of the Canton Steel Co., is visiting the home office of the company, Canton, Ohio.

W. A. STEVENS, who built the cyanide works at Bland, N. M., is in Denver, Colo., making experiments on various kinds of ore.

F. H. BOSTWICK, head salesman for the Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., has returned from a business trip through Arizona.

W. A. CLARK expects that his new mill at Ophir, Utah, will be in operation about Feb. 15th, when the daily 350-ton production of the mine will be worked.

BEN WILLIAMS, the retiring Supt. of the Copper Queen M. Co., Bisbee, Ariz., was, on the 15th inst., given a memorial gold cup by his former associates.

J. F. WEBB of the Pneumatic Cyanide Process, Denver, Colo., recently made examination of copper properties in southern Utah for parties in Paris, France.

CHAS. BUTTERS, who won fame and fortune as a cyanide manager on the Rand in South Africa, is in San Salvador, C. A., where he has large mining interests.

C. P. SCHUMACHER of Leadville, Colo., recently secured an option on a large tract of coal land in Larimer county, Colo., where an extensive ledge of lignite is found.

T. C. MARTIN has been selected by the American Institute of Electrical Engineers to represent that body at the World's Congress of Electrical Engineers at the Paris Exposition.

Recently Declared Mining Dividends.

Tamarack C. M. Co., Michigan, $6 per share; Dec. 28.

Lillie G. M. Co., Cripple Creek, Colo., $11,250; Dec. 20.

Pennsylvania M. Co., Grass Valley, Cal., $10,300; Dec. 25.

Modoc C. Co., Colorado, $5000; Dec. 18; and $10,000 Dec. 23.

United Verde C. Co., Arizona, 50 cents per share, $150,000; Dec. 21.

Parrot C. M. Co., Butte, Mont., $1.50 per share; payable Jan. 10, 1900.

Deer Trail No. 2 S. M. Co., Washington, $2500; Dec. 25. Total to date, $47,500.

Boston & Colorado Smelting Co., quarterly dividend of 1½%; payable Jan. 1.

Boston Q. M. Co., California, 10 cents per share, $10,000; payable Jan. 1, 1900.

Amalgamated Copper M. Co., quarterly dividend of 1½% and extra dividend of ½%; payable Jan. 22.

Ætna Q. M. Co., California, regular 10 cents and extra 5 cents per share, $15,000; payable Jan. 1, 1900.

New Idria Q. M. Co., California, regular 10 cents and extra 10 cents per share, $20,000; payable Jan. 1, 1900.

Napa Con. Q. M. Co., California, regular 10 cents and extra 10 cents per share, $20,000; payable Jan. 1, 1900.

American Smelter & Refining Co., New York, quarterly dividend 1¾%; payable Jan. 9, 1900, on the preferred stock.

Homestake G. M. Co., South Dakota, regular monthly 25 cents and extra 25 cents per share, $105,000; Dec. 26. Total to date, $8,143,750.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DISPENSING CAN FOR LIQUIDS.—C. M. Husted, Prescott, Ariz. No. 639,393. Dated Dec. 19, 1899. This invention relates to a dispensing can for oil, gasoline or other liquids. The can has a screw cap for the introduction of the liquid; a pouring spout extending from the bottom upwardly outside the can, with an inwardly turned end above the level of the top of the can. A horizontally fixed cylindrical spout extends partly across the top of the can, and beyond the inturned end of the upwardly projecting spout, which inturned end is enclosed within a horizontal spout. A spring-pressed valve or stopper closes against the inturned end of this spout, and a lever or suitable connecting mechanism serves to withdraw it when it is desired to pour liquid, then by tilting the can the liquid flows up the spout from the bottom and through the inturned end, thence passing out through the horizontal spout. The filling opening preferably has a strainer extending down from it into the can to prevent the introduction of heavy or foreign substances.

SASH FASTENER.—G. W. Manuel, Oakland, Cal. No. 639,419. Dated Dec. 19, 1899. This invention relates to a device for fastening windows so as to make them burglar-proof, and also to prevent their rattling. It consists of a spring-pressed bolt slidable horizontally through the rail of one sash, and having lugs projecting radially from its outer end, a keeper fitted to the rail of the companion sash with an opening through it adapted to admit the lugs of the bolt, and having inclined or cam-shaped surfaces so that when the bolt is turned the lugs engage these surfaces and draw the sashes together, locking them firmly in place. The keeper has an upward extension inclined rearwardly, so that when the sashes are closed, the projecting end of the bolt striking this incline will be pushed inward sufficiently to allow the sashes to pass each other, after which when fully closed the bolt will be shot forward by its spring and will thus latch the window to prevent its being opened. The turning of the bolt afterwards insures such a locking as will hold the two firmly together.

BOILER. — Benjamin Holt, Stockton, Cal. No. 639,390. Dated Dec. 19, 1899. This invention is intended to provide improvements in portable boilers of that class having water legs extending down upon each side of the furnace and combustion chamber for the whole length of the boiler. As usually constructed the connection between these water legs and the shell of the boiler is such that the strain upon the boiler caused by the swelling motion of moving over rough grounds wrenches and disengages the fastening so that such boilers rapidly become leaky. In this invention the inner sheet of the water leg has its upper end curved into an arc or segment, this curved end extending a short distance inwardly below the boiler, and it is riveted to the shell of the boiler along the line of contact. This curvature forms a strong base for the boiler, and in addition provides a much more complete and open connection for the rapid circulation of water within the water legs.

RAILWAY ORE PULVERIZER. — H. Mann, Piute, Cal. No. 639,418. Dated Dec. 19, 1899. The object of this invention is to provide a means for crushing ore on a large scale and an economical application of power, so that low grade or other ores can be reduced in large quantities and with rapidity. It consists of a single circular trough of short segments abutting and forming tight joints at their meeting ends, said segments having upwardly divergent sides with flanges at the top. Upon these flanges rails are secured and a mortar or car of any description is adapted to travel upon these rails. This car is connected with its axles by loose links, heavy spiked and smooth rollers, one following the other, so that as the car travels around the circumference of the apparatus these rollers serve to pulverize the ore within the trough. Behind these rollers a heavy drag or drags are made to follow, being also connected with the car, and thus the ore is finally pulverized as finely as may be desired.

DETACHABLE LEAF LEDGER.—E. Marsky, San Jose, Cal. No. 639,420. Dated Dec. 19, 1899. This invention relates to detachable or loose-leafed ledgers. It comprises metallic bars having toothed clamps or other fastenings coincident with slots, which are made in the inner edges of the loose leaves, and through which said clamps are adapted to pass. A slidable locking strip or wire is adapted to engage the sections, so as to secure the leaves in place. The sections are attached to flexible strips of bendable material, which strips are bent so as to form a book of any desired number of sections. Each leaf or leaves of the independent sections may be removed single or together, and others may be replaced so that the book can be perpetually kept up by adding new leaves as soon as the old ones are removed and filed.

Latest Market Reports.

SAN FRANCISCO, Dec. 28, 1899.

SILVER—Per oz., Troy: London, 27d (standard ounce, 925 fine); New York, bar silver, 58⅝ cts. (1000 fine); San Francisco, 58⅜: Mexican dollars, 48c.

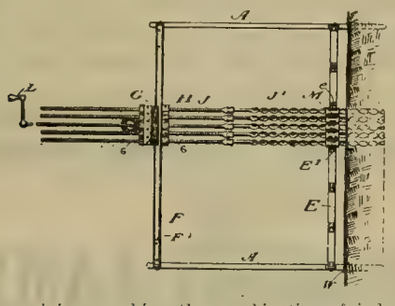
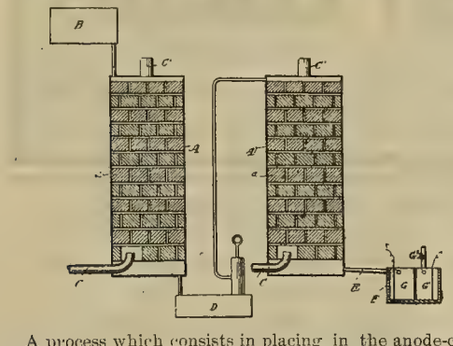
Latest Mining and Metallurgical Patents.

Patents Issued Dec. 19, 1899.



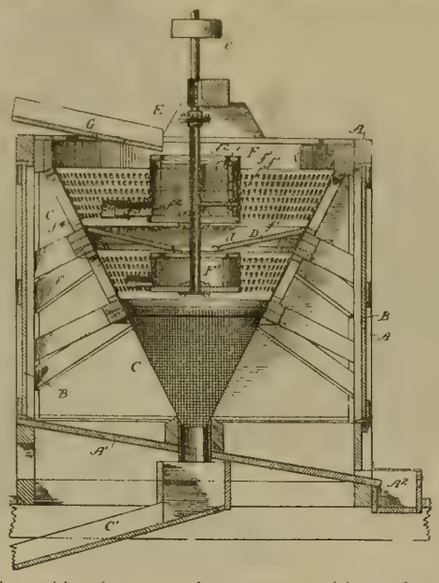
Specially Reported for the MINING AND SCIENTIFIC PRESS.

MANUFACTURE OF LEAD OXID.—No. 639,209; W. E. S. Bunn and E. J. Case, Peoria, Ill.



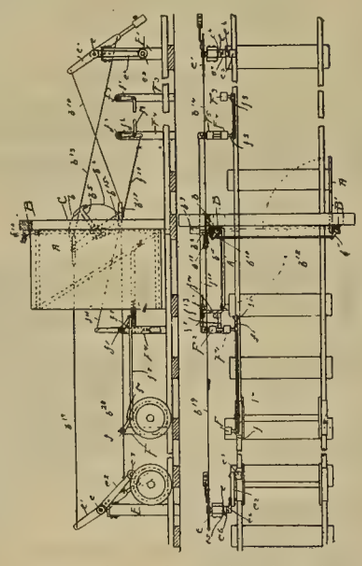
An improvement in making lead oxid and white lead, continuously, consisting in, first, reducing metallic lead by attrition and agitation in water; second, conducting the comminuted lead, mixed with water, into a separate vessel and therein subjecting the same to a rolling and tumbling motion in the presence of compressed air; third, settling the non-oxidized metallic lead and floating off of the lead oxid, and then subjecting the lead oxid, mixed with water, to a further rolling and tumbling motion and to the action of carbon dioxid under pressure.

MINING MACHINE.—No. 639,267; W. T. Moss, Walsall, Pa.



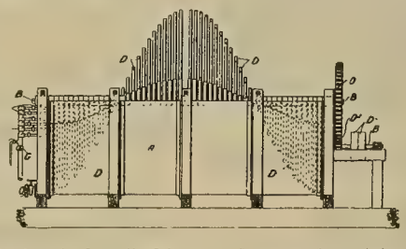
In a mining machine the combination of independently adjustable and reversible vertical standards, each having a C-slot in one end, and the horizontal drill-press carried by C-slots and provided with bearings at opposite ends thereof. A framework comprising the posts A, the four standards secured to the same, a pair of horizontal supports carried by the standards and parallel with each other and with the vein to be drilled, a hanger slidable along one of supports and carrying a multiple drill-press, a guide-block for the other end of the drill-press and projections upon the other of the supports carrying the guide-block. The combination of the posts A having eyes a, the vertical standards B and B′ having pluralities of eyes b adapted to register with eyes a, the laterally-open C-shaped slot in one end of each vertical standard, and the horizontal drill-press supports resting in and sustained by the C-shaped slots. The combination of the standards having laterally-open C-shaped slots, the horizontal supports E and F carried in the C-shaped slots, the drill-press hanger carried by the support F, and the guide-block carried by C-shaped slots on the said support E.

PROCESS OF RECOVERING ZINC FROM REFRACTORY ZINC-BEARING ORES.—No. 639,579; J. Jones, East Melbourne, Victoria.



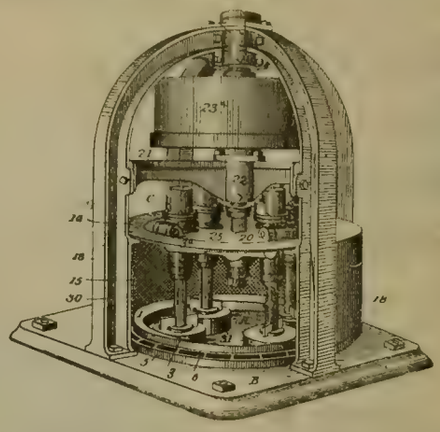
A process which consists in placing in the anode-compartment of a cell having a suitable diaphragm, a mixture of sulphate of zinc and sulphate of ammonium, placing in the cathode-compartment an acid solution containing sulphate of zinc, passing an electric current through both solutions, whereby zinc and ammonium are set free at the cathode, and continuously adding to the cathode solution sufficient acid solution containing zinc sulphate to neutralize the ammonium liberated in solution and to maintain in the solution a low degree of acidity.

ORE SEPARATOR.—No. 639,433; A. Pratt, Butte, Mont.



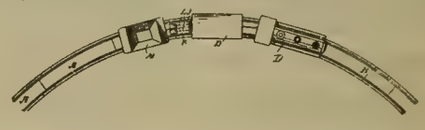
A machine for separating ores comprising a funnel-shaped screen and a rotating bucket or distributor centrally disposed within screen, bucket or distributor being divided by partitions into separate compartments, compartments having floors at different heights, and each of compartments having an opening in its side wall above its floor through which the material is thrown against the screen.

MINE-GATE.—No. 639,629; W. H. Tschantz, Orrville, Ohio.



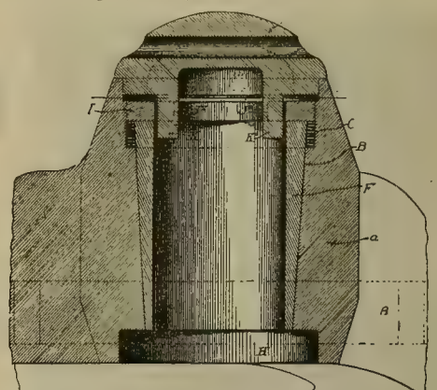
In a mine-trap door, the combination of oppositely-disposed gates mounted upon vertical shafts, provided with crank-levers coupled together, depending oscillating clutch-levers, journaled at the side of the track, and upon both sides of the gates, a bevel-gear train communicating with one of the vertical shafts, and wires connecting the gear-train with the oscillating clutch-levers.

MEANS FOR MIXING AND AERATING SANDS OR TAILINGS WHILE UNDER TREATMENT BY SOLVENTS.—No. 639,540; W. Duncan, Day Dawn Ridge, Charters Towers, Queensland.



The herein described improved means for mixing and aerating sands, tailings and the like, comprising a semicircular vat, a horizontal rotatable shaft journaled therein, arms helically arranged on which depend into close proximity to the bottom, a plurality of outlets arranged at varying levels and uniting in a common pipe leading to the sump, a cock in pipe and an independent pipe leading from discharge pipe to a filter, and having a cock and a discharge sluice for draining said vat.

JOURNAL BOX FOR PULVERIZING MACHINES.—No. 639,360; J. C. Clark, Atlanta, Ga.



The combination with a shaft having a collar below its end, of a box enclosing the end of the shaft, a brass fitted within the box below collar, and a second box fitted within the box above the collar, oil chambers within the box, one with an opening leading to the collar, and the other with an opening leading to the upper brass.

RAILWAY ORE PULVERIZER.—No. 639,418; H. Mann, Piute, Cal.

In an ore-crushing apparatus, a circular sectional trough having the rails of a track fixed upon the flanges forming the top of the trough, a motor, the wheels of which are adapted to travel upon track, a second car connected with and drawn by motor, links loosely connected with the front and rear axles, and inclining backwardly therefrom, a spiked crushing and digging roller, the shaft of which is journaled to the front set of links, a corrugated crushing roller similarly connected with the rear set of links, a plurality of heavy, flat-bottomed drags with chains extending from the front of the tracks to the rear of the car, and a mechanism by which the drags may be moved to or from each other.

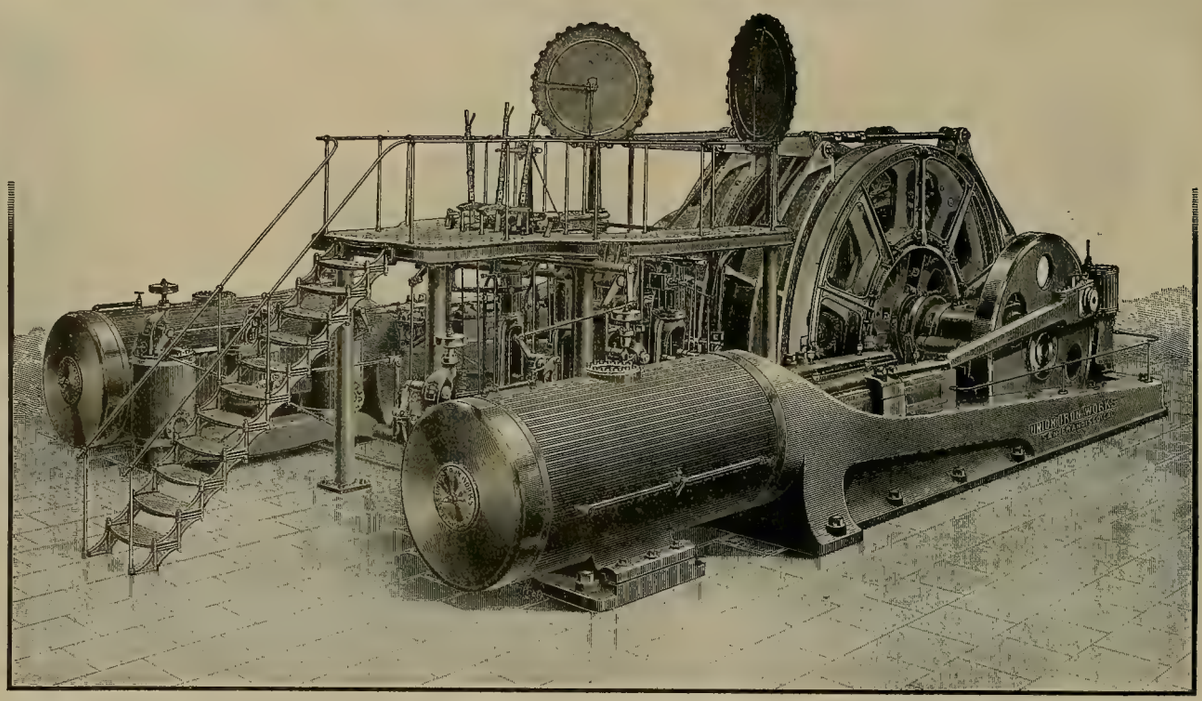
ROCK AND ORE BREAKER.—No. 636,558; E. E. Hanna and T. W. Capen, Chicago, Ill.

In rock and ore breakers, the combination of a gyratory shaft, a spider portion provided with a central hub having a tapered axial opening, a portion of such opening being counterbored and threaded and the upper portion being bored to form a true concentric cylindrical surface, a longitudinal split tapered bushing in the tapered portion of the spider opening with its longitudinal edges in rigid engagement with each other, a ring nut in the threaded opening for adjustably holding the longitudinal edges of the tapered bushing in rigid contact with each other and the bushing in rigid engagement with the spider, and a cap in the upper smooth bore of the spider opening engaging with the ring nut to operate the same.

A CORD of spruce wood is equal to 615 feet broad measure, and this quantity of raw material will make half a ton of sulphite pulp, or one ton of ground wood pulp. Newspaper stock is made up with 20 per cent of sulphite pulp and 80 per cent of ground wood pulp. The best spruce land, virgin growth, possesses a stand of about 7000 feet to the acre, taking the best as a basis. Twenty-two acres of this best spruce land will therefore contain 154,000 feet of timber. An average gang of loggers will cut this in about eight days. This entire quantity of wood turned in at any one of the large mills will be converted in a single day into about 250 tons of such pulp as goes to make up newspaper stock. This pulp will make about an equal weight of paper, which will supply a single metropolitan newspaper two days.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

Up-to-date Miners who value their lives use

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

NO. 2 LAMP.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1½ C. P.	Price complete,	$4.50.	For meter reading only.
No. 2 " 3 " 4 "	" "	6.00.	For Miners and general use.
No. 3 " 12 " 10 "	" "	12.00.	For several persons to work by.
No. 4 " 3 " 4 "	" "	6.00.	Boiler Makers and Chimney Sweeps.

SAMPLE LAMP SENT ON RECEIPT OF PRICE. **Illustrated Catalogue is yours for the asking.**

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

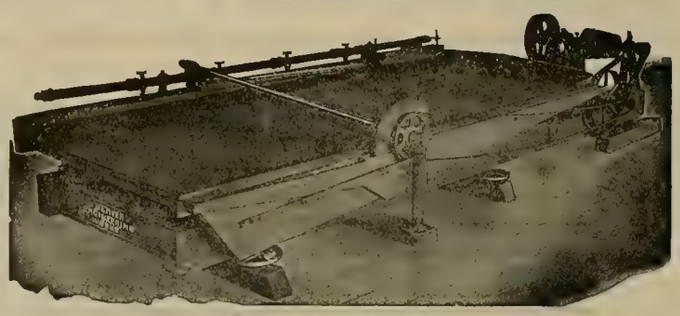
Gold, Silver, Lead, Copper and Pyritic Ores.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



(SEE PAGE 766.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

ADAMANTINE SHOES AND DIES.

CHROME CAST STEEL.

CANDA Improved Self-Locking CAMS.

TAPPETS, BOSSES, ROLL SHELLS AND CRUSHER PLATES.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

THE

"Pneumatic" Cyanide Process.

(Patented in United States, South African Republic, New Zealand, Victoria, New South Wales, South Australia; other patents pending.)

Supplies the solution with the oxygen required for perfect extraction. Prevents settling, packing and channelling. Heats the solution and prevents freezing in winter. Doubles the capacity by requiring less than one-half the usual time. Saves the highest percentage of values at the lowest cost per ton. *"Mill rights" sold direct to users; no royalties.*

The above illustration shows an operator taking an inclino above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to

No. 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A 10

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of November, 1899, an assessment (No. 21) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 2nd day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 22nd day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, California.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras county, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of November, 1899, an assessment (No. 3) of ten cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 20th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
E. P. HEALD, Secretary.
Office—Heald's Business College, 24 Post Street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of December, 1899, an assessment (No. 22) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 27th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office—Room 31, No. 214 Pine street, San Francisco, California.

SAVAGE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.
Notice is hereby given, that at a meeting of the Board of Trustees, held on the 8th day of December, 1899, an assessment (No. 99) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 10th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 30th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

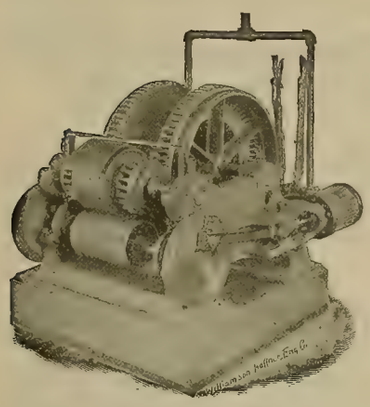
THE JOHNSTON CONCENTRATOR.



DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Hoisting from the 2600-foot level with

..Our Baby Hoist..

A remarkable record--don't you think?

READ WHAT THE SUPERINTENDENT OF COLORADO'S DEEPEST MINE SAYS:

THE GEYSER MINING AND MILLING CO., SILVER CLIFF, COLO.

The Hendrie & Bolthoff M'f'g & Supply Co., Denver, Colo.—GENTLEMEN: It may be of interest to you to know that we are now down 2600 feet with your Baby Hoist (4x6 Double Cylinder) which we purchased some time since. With this engine we are now handling the rock and ore broken by three shifts of four men each, and have had no difficulty whatever in so doing.

This engine stands in our 2400-foot level and is hoisting from the 2600-foot level. It is operated by air.

Very truly yours, W. J. ELMENDORF, Superintendent.

St. Valentine's Day, 1899.

We are selling these on a guarantee to hoist 1000 pounds 200 feet per minute from a depth of 350 feet.

$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

THE WESTERN CHEMICAL COMPANY,

DENVER, COLO.,

For Laboratory Use and Fine Chemical Work. Also Commercial Acids, Blue Vitriol, etc., etc.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

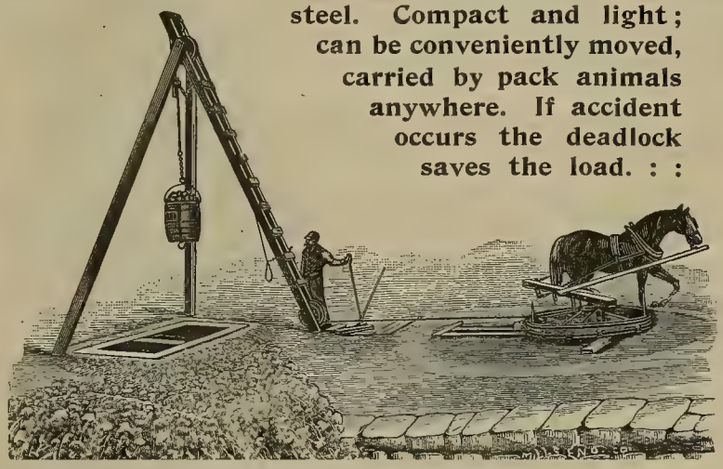
RIVETED SHEET STEEL WATER PIPE
For Placers, Water Powers, Irrigation, Etc.
THE WEIGELE PIPE WORKS
2949-51 Larimer St. DENVER, COLO.



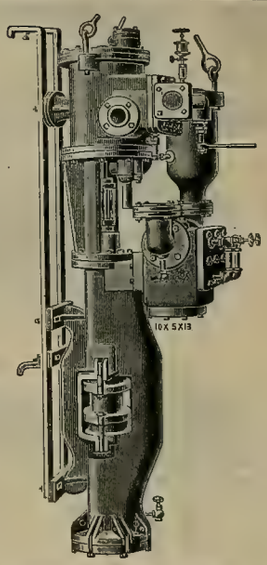
For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.

KEYSTONE DRILLER CO., Beaver Falls, Pa.

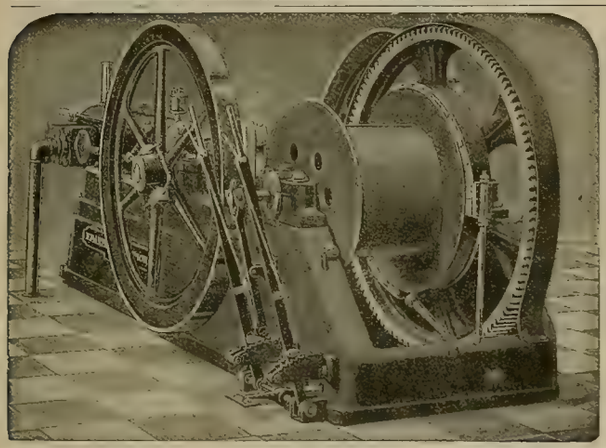
THE COMMON SENSE WHIM

Is made of the best wrought iron and steel. Compact and light; can be conveniently moved, carried by pack animals anywhere. If accident occurs the deadlock saves the load. : :



SINKING PUMPS,

Indispensable in sinking mining shafts or pumping out flooded mines. Easily raised or lowered by cable or rope. Equipped with outside packed plungers. Handles gritty or dirty water. Operates bolted to shaft timbers or only suspended by cable at any angle. Packing glands external. May be adjusted while in motion. Removable parts hinged. Steam movement positive and simple.



THE RISDON IRON WORKS,

MANUFACTURERS.

SAN FRANCISCO, CAL.
